Summary

The possibility of the production at high energy of heavy quarks, supersymmetric particles and other large mass colored systems via the intrinsic twist-six components in the proton wave function is discussed. While the existing data do not rule out the possible relevance of intrinsic charm production at present energies, the extrapolation of such intrinsic contributions to very high masses and energies suggests that they will not play an important role at the SSC.

sufficiently large. The data from the EMC collaboration⁴ on deep-inelastic muon scattering could also be interpreted as suggesting an unexpectedly large charm structure function in the region $x > 0.3$.

The possible existence of such a new production mechanism is of great importance for design considerations at the SSC^{5,6}. An example of the importance of this issue is that, if intrinsic large x production is dominant, experiments and, perhaps, even the machine should be designed to focus on the forward "diffractive" regime⁵. The ques-

Evidence for intrinsic charm quarks in the proton

[The NNPDF Collaboration](#)[Nature](#) 608, 483–487 (2022) | [Cite this article](#)[Metrics](#)

Abstract

The theory of the strong force, quantum chromodynamics, describes the proton in terms of quarks and gluons. The proton is a state of two up quarks and one down quark bound by gluons, but quantum theory predicts that in addition there is an infinite number of quark–antiquark pairs. Both light and heavy quarks, whose mass is respectively smaller or bigger than the mass of the proton, are revealed inside the proton in high-energy collisions. However, it is unclear whether heavy quarks also exist as a part of the proton wavefunction, which is determined by non-perturbative dynamics and accordingly unknown: so-called intrinsic heavy quarks¹. It has been argued for a long time that the proton could have a sizable intrinsic component of the lightest heavy quark, the charm quark. Innumerable efforts to

Une étude confirme que le proton possède un quark charm intrinsèque

Fleur Brosseau - 19 août 2022

VALENTINA GUDIELMO SCIENZA 29.08.2022

Un nuovo studio fa luce su una sorprendente caratteristica della struttura dei protoni

Pubblicato sulla rivista Nature spiega come anche i quark charm, insieme ai più noti e leggeri quark up e quark down, siano da annoverarsi tra i componenti intrinseci dei costituenti atomici, confermando un'ipotesi elaborata oltre 40 anni fa

Physicists surprised to discover the proton contains a charm quark

The textbook description of a proton says it contains three smaller particles - two up quarks and a down quark - but a new analysis has found strong evidence that it also holds a charm quark

WHAT IS
INTRINSIC CHARM?

WHAT IS INTRINSIC CHARM?

PDFs AT HIGH SCALE

$$Q = 100 \text{ GeV}$$

- **SEA PDFs** AT HIGH SCALE **ALL LOOK ALIKE**

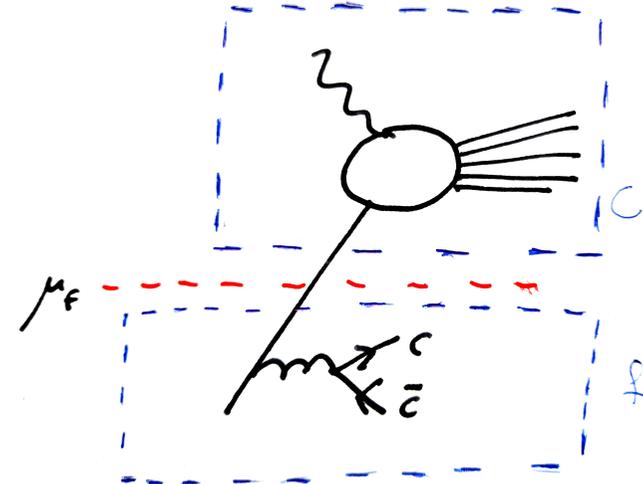

- IF $Q \gg m_c$, CHARM **MASS NEGLIGIBLE**: $\ln \frac{Q^2 + m_c^2}{m_c^2} \approx \ln \frac{Q^2}{m_c^2}$

- **GLUON RADIATION IS FLAVOR BLIND**

WHAT IS **NOT** INTRINSIC CHARM?

- **FACTORIZED** STRUCTURE FUNCTION: $F_2 = \sum_i C_i \otimes f_i$
- COLLINEAR **PARTON RADIATION** UP TO μ_f
INCLUDED IN PDFs f_i
- **CHARM PDF PERTURBATIVELY GENERATED** BY QCD EVOLUTION

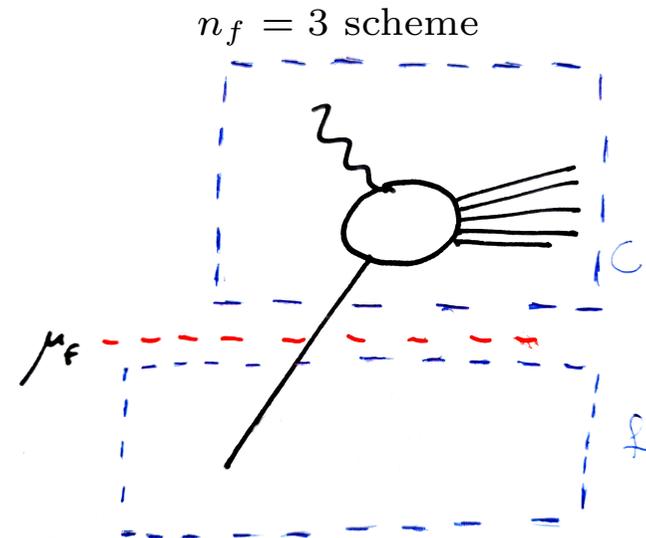

perturbative charm generation

- **MASSIVE QUARKS** \Rightarrow **NO COLLINEAR SINGULARITY**
- .
- .

WHAT IS **NOT** INTRINSIC CHARM?

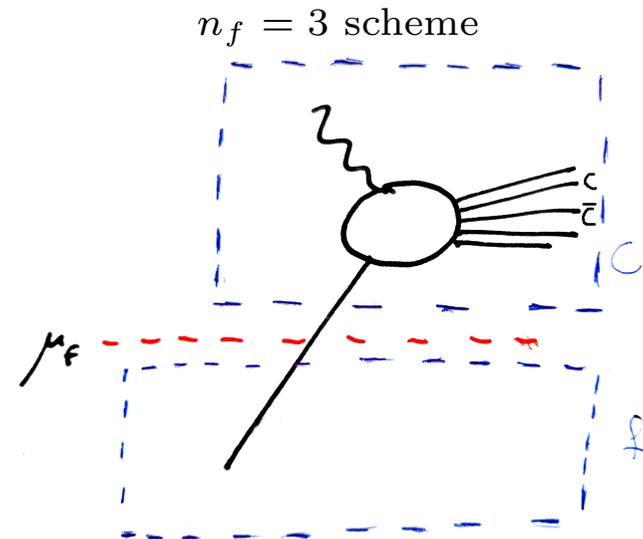

- **FACTORIZED** STRUCTURE FUNCTION: $F_2 = \sum_i C_i \otimes f_i$
- COLLINEAR **PARTON RADIATION** UP TO μ_f
INCLUDED IN PDFs f_i
- **CHARM PDF PERTURBATIVELY GENERATED** BY QCD
EVOLUTION

- **MASSIVE** QUARKS \Rightarrow **NO COLLINEAR SINGULARITY**
- MAY WORK IN $n_f = 3$ **SCHEME** \Rightarrow CHARM **DECOUPLES** FROM PDF EVOLUTION
- .

WHAT IS **NOT** INTRINSIC CHARM?

- **FACTORIZED** STRUCTURE FUNCTION: $F_2 = \sum_i C_i \otimes f_i$
- COLLINEAR **PARTON RADIATION** UP TO μ_f
INCLUDED IN PDFs f_i
- **CHARM PDF PERTURBATIVELY GENERATED** BY QCD
EVOLUTION

- **MASSIVE** QUARKS \Rightarrow **NO COLLINEAR SINGULARITY**
- MAY WORK IN $n_f = 3$ **SCHEME** \Rightarrow CHARM **DECOUPLES** FROM PDF EVOLUTION
- PERTURBATIVE CHARM PRODUCTION IN **COEFFICIENT FUNCTION**

WHAT IS INTRINSIC CHARM?

NAIVE ANSWER

- IN $n_f = 4$ SCHEME, PERTURBATIVELY GENERATED CHARM

$$c(x, Q^2) \sim \alpha_s \ln \frac{Q^2}{M_c^2} P_{qg} \otimes g$$

- PERHAPS LOOK AT $c(x, Q^2 = M_c^2)$?
- BUT ACTUALLY $c(x, Q^2) \sim \alpha_s \ln \frac{Q^2(1-x)/x}{M_c^2} P_{qg} \otimes g \Rightarrow$ SAME UP TO $O(\alpha_s^2)$
- SO LOOK AT $O(\alpha_s^2) \Rightarrow$ SCALE AT WHICH CHARM VANISHES?
- AT $O(\alpha_s^2)$ IT NEVER DOES!

DECOUPLING

- DECOUPLING SCHEME \Rightarrow HEAVY FLAVOR GRAPHS
SUBTRACTED AT ZERO MOMENTUM (Collins, Wilczek, Zee, 1978)
- $N_f = 3$ ACTIVE FLAVORS IN β FUNCTION & EVOLUTION EQUATIONS
- DECOUPLING VS $\overline{\text{MS}}$ \Leftrightarrow DIFFERENT RENORMALIZATION & FACTORIZATION SCHEMES

MATCHING

- PDFs, α_s IN $N_f = 3$ & $N_f = 4$
RELATED BY MATCHING CONDITIONS

- DETERMINED BY COMPUTING

OPERATOR MATRIX ELEMENTS

IN EITHER SCHEME AND EQUATING:

NNLO (Buza, et al., 1998),

$N^3\text{LO}$ (Ablinger, Blümlein et al, 2009-2017)

OME CONTRIBUTING
TO THE CHARM PDF
SOLID \Rightarrow HEAVY; DASHED \Rightarrow LIGHT

M. Buza et al.: Charm

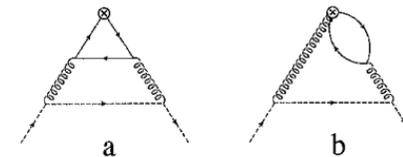

Fig. 2. $O(\alpha_s^2)$ contributions to the purely-singlet OME $A_{q'q}^{\text{PS}}$. Here q and q' are represented by the *dashed* and *solid lines* respectively. In the case of $q' = H$ these graphs contribute to the heavy-quark OME A_{Hq}^{PS}

WHAT IS **NOT** INTRINSIC CHARM?

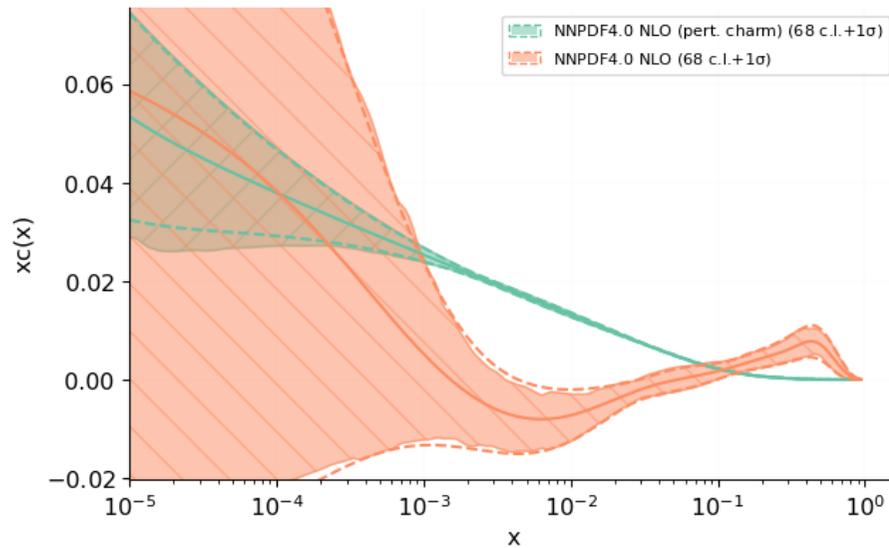

PERTURBATIVE CHARM

- IN $N_f = 3$ SCHEME **CHARM PDF VANISHES**
- IN $N_f = 4$ SCHEME, CHARM **DETERMINED BY PERTURBATIVE MATCHING**
- STARTING AT NNLO (TWO LOOPS) **DOES NOT VANISH AT ANY SCALE**
- .

PERTURBATIVE CHARM PDF, $n_f = 4$ SCHEME, $Q=1.7$ GeV

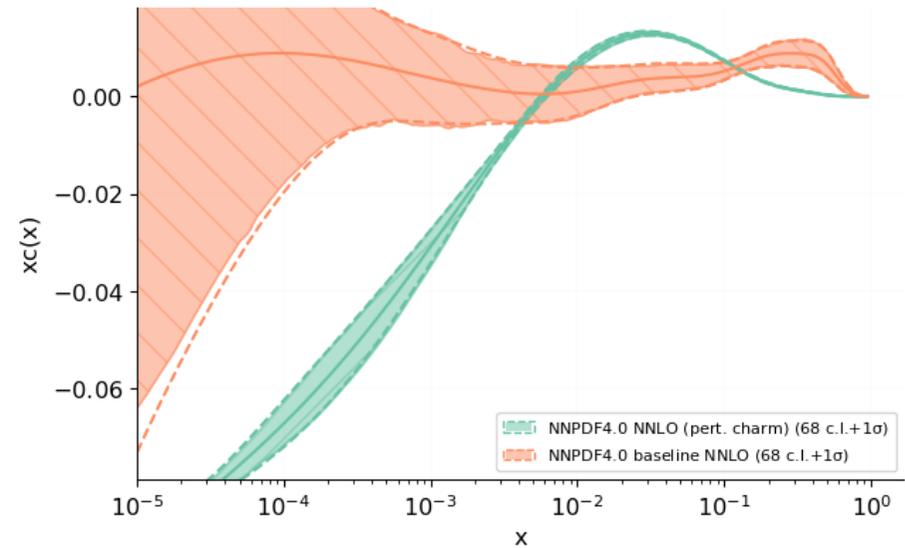

NLO

c at 1.7 GeV

NNLO

c at 1.7 GeV

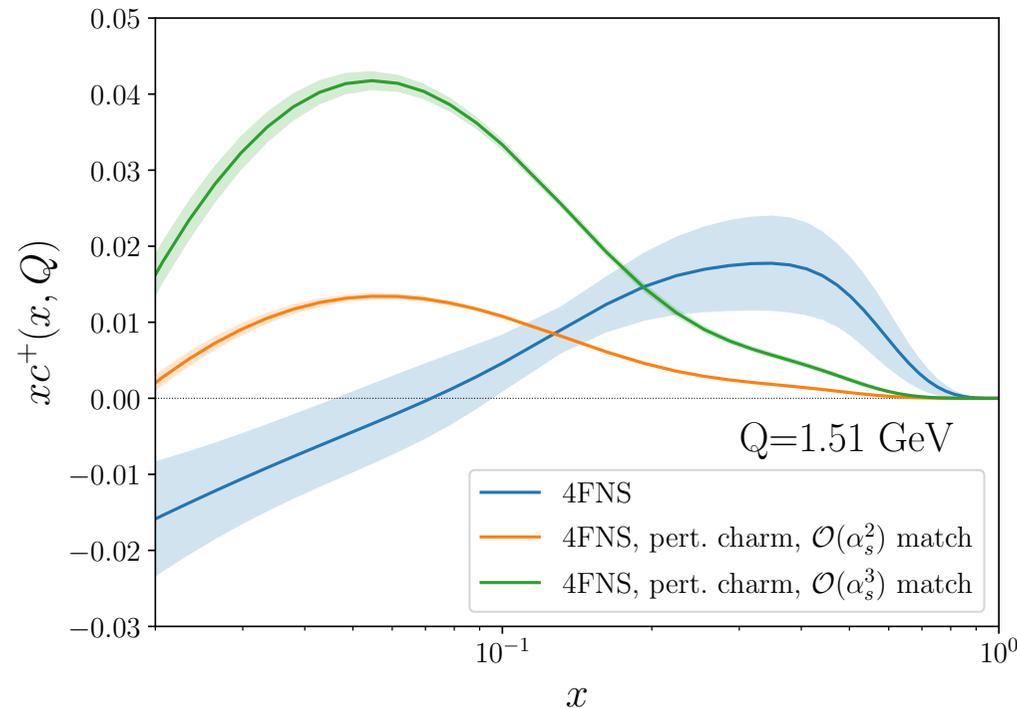

WHAT IS **NOT** INTRINSIC CHARM? PERTURBATIVE CHARM

- IN $n_f = 3$ SCHEME **CHARM PDF VANISHES**
- IN $N_f = 4$ SCHEME, CHARM **DETERMINED BY PERTURBATIVE MATCHING**
- STARTING AT NNLO (TWO LOOPS) **DOES NOT VANISH AT ANY SCALE**
- **SLOW** PERTURBATIVE CONVERGENCE \Rightarrow NNLO AND N³LO **DIFFER** SIGNIFICANTLY

PERTURBATIVE CHARM PDF, $n_f = 4$ SCHEME, $Q=1.7$ GeV

NNLO vs. **N³LO**
(NLO IDENTICALLY ZERO)

WHAT IS INTRINSIC CHARM?

- **DEFINE** CHARM PDF AS OME:

$$\langle p | \bar{c} \gamma^{\mu_1} D^{\mu_2} \dots D^{\mu_n} c | p \rangle = A_c^n p^{\mu_1} \dots p^{\mu_n} - \text{traces}$$

$$A_c^n = \int_0^1 dx x^{n-1} c(x)$$

- **DO NOT FACTOR CHARM MASS SINGULARITIES** INTO OME
- \Rightarrow **CHOOSE** $n_f = 3$ SCHEME
- **CHARM PDF PURELY INTRINSIC**, SCALE-INDEPENDENT

INTRINSIC CHARM IS CHARM IN THE $N_F = 3$ (DECOUPLING) SCHEME

HOW CAN ONE MEASURE INTRINSIC CHARM? (ALMOST) LIKE ANY OTHER PDF

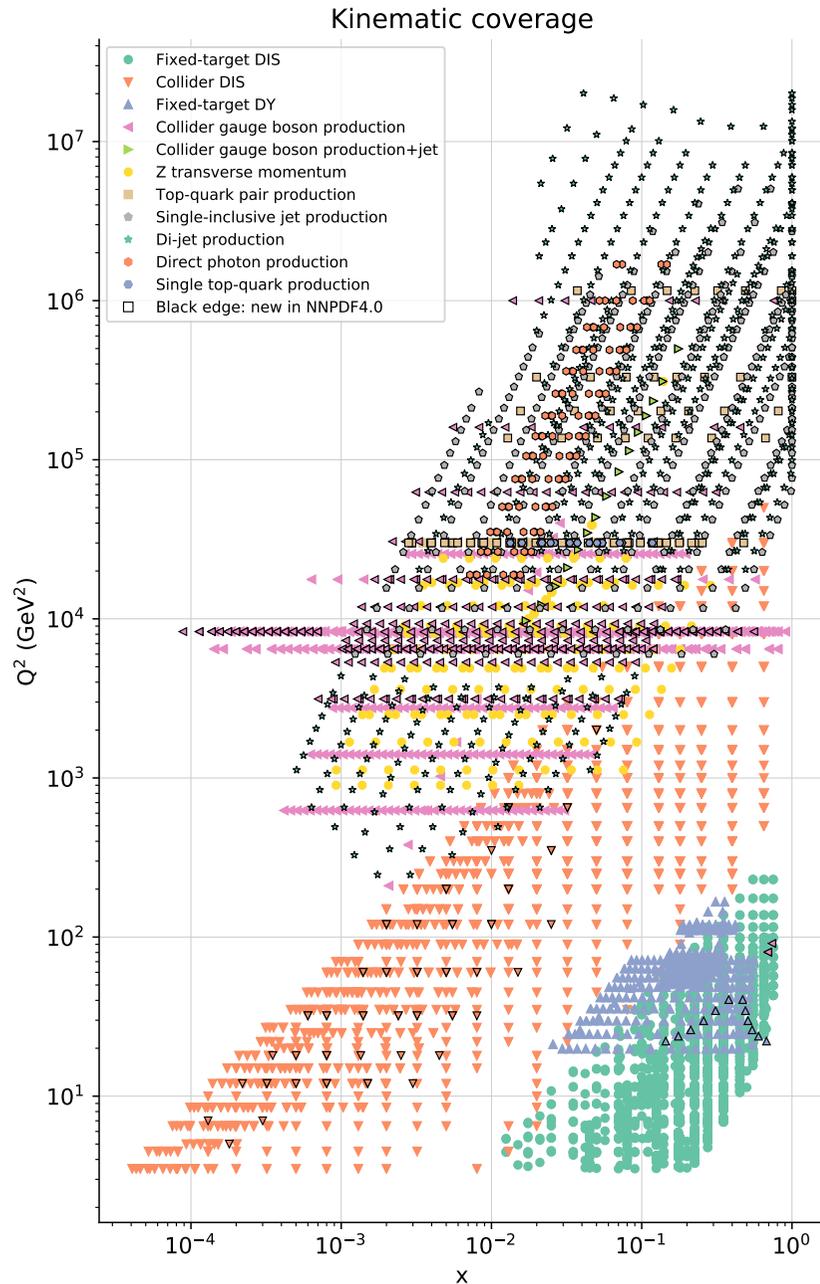

- DETERMINE PDFS FROM DATA
- GO TO $n_f = 3$ SCHEME
- LOOK AT RESULT

TWO POSSIBILITIES

- PARAMETRIZE PDFS IN $n_f = 3$ SCHEME AND MATCH UP FOR FITTING
- PARAMETRIZE PDFS IN $n_f = 4$ SCHEME AND MATCH DOWN FOR DETERMINING IC
- REMEMBER: MATCHING PERTURBATIVELY UNSTABLE \Rightarrow LARGE MHO

PDF DETERMINATION: NNPDF4.0

DATA

- COMPARED TO NNPDF3.1/PDF4LHC21 ABOUT **50 NEW DATASETS** & 400 EXTRA DATAPOINTS
- FULL DIS AND FT DY DATASET
 - AS IN NNPDF3.1: FINAL HERA, NMC, BCDMS, CHORUS, NuTeV
 - NOW ALSO **NOMAD NEUTRINO**
 - **SEAQUEST DY**
- FULL 7 TEV AND 8 TEV DATASET & EXTENSIVE USE OF **13 TEV** DATA:
 - *W*, *Z* PRODUCTION: RAPIDITY DISTRIBUTIONS, ASYMMETRIES, *Z* p_T DISTRIBUTIONS
 - TOP PAIR PRODUCTION: ALL AVAILABLE DISTRIBUTIONS
 - SINGLE-INCLUSIVE JETS
- SEVERAL **NEW PROCESSES**:
 - PROMPT PHOTON
 - SINGLE TOP
 - DIJETS
 - HERA JETS

DISCOVERY OF INTRINSIC CHARM

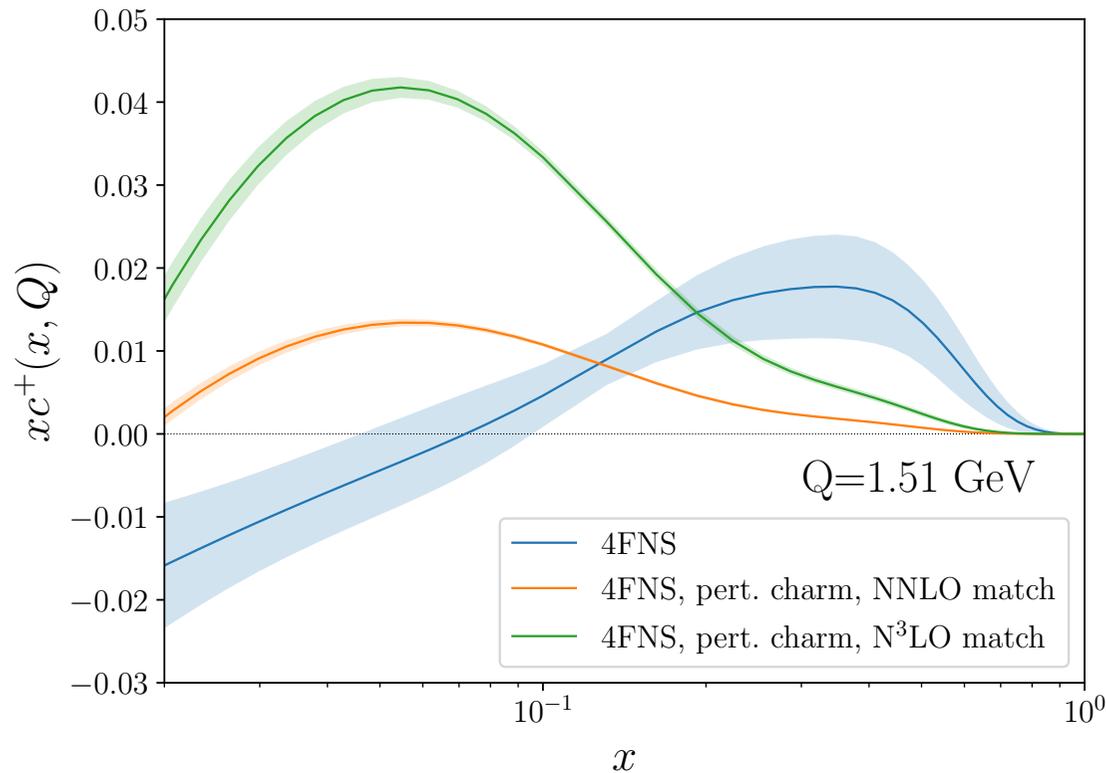

THE CHARM PDF ($n_f = 4$ SCHEME) NNPDF4.0 vs. NNPDF3.1

- NNPDF CHARM PDF \Rightarrow DETERMINED FROM THE DATA ALONG WITH ALL OTHER PDFs:
 - MORE REALISTIC UNCERTAINTIES
 - INDEPENDENT OF MATCHING CONDITIONS:
 - * STABLE UPON VARIATION OF m_c
 - * INSENSITIVE TO MHO CORRECTIONS
- AGREES WITH PREVIOUS DETERMINATION
- SIGNIFICANTLY SMALLER UNCERTAINTIES

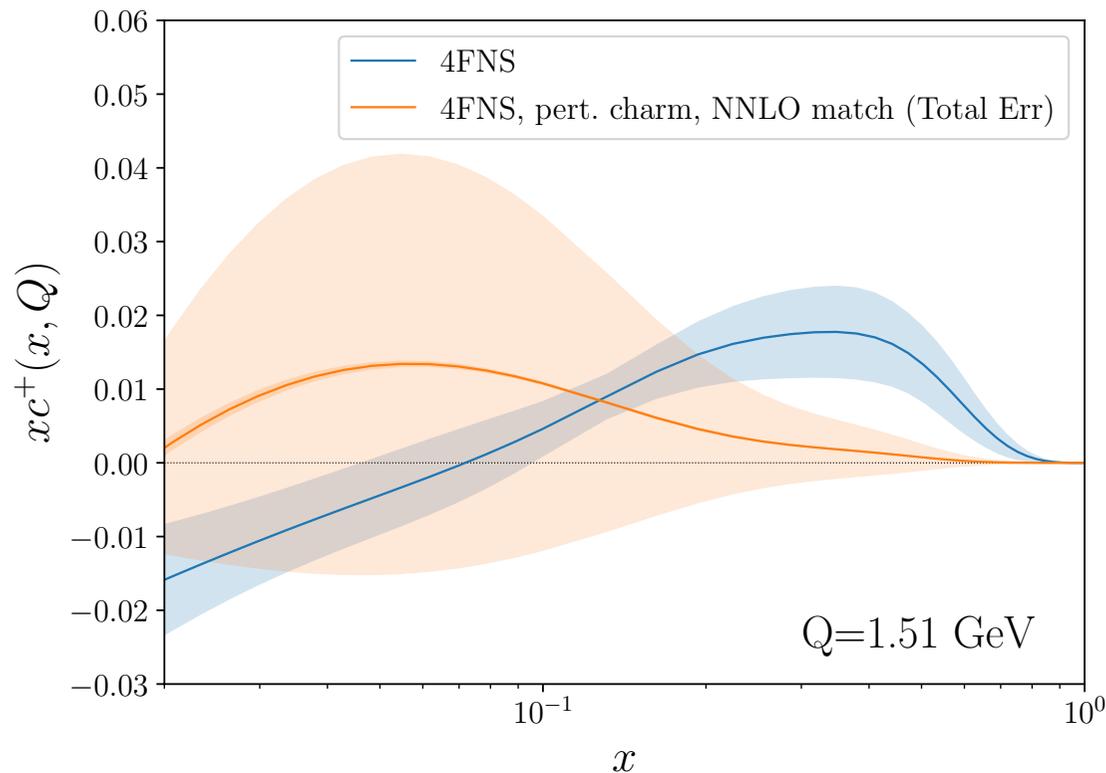

THE CHARM PDF ($n_f = 4$ SCHEME) FITTED VS PERTURBATIVE

- NNPDF CHARM PDF \Rightarrow DETERMINED FROM THE DATA ALONG WITH ALL OTHER PDFs:
 - MORE REALISTIC UNCERTAINTIES
 - INDEPENDENT OF MATCHING CONDITIONS:
 - * STABLE UPON VARIATION OF m_c
 - * INSENSITIVE TO MHO CORRECTIONS
- DIFFERS SIGNIFICANTLY FROM PERTURBATIVE CHARM

THE CHARM PDF ($n_f = 4$ SCHEME) FITTED VS PERTURBATIVE

- NNPDF CHARM PDF \Rightarrow DETERMINED FROM THE DATA ALONG WITH ALL OTHER PDFs:
 - MORE REALISTIC UNCERTAINTIES
 - INDEPENDENT OF MATCHING CONDITIONS:
 - * STABLE UPON VARIATION OF m_c
 - * INSENSITIVE TO MHO CORRECTIONS
- DIFFERS SIGNIFICANTLY FROM PERTURBATIVE CHARM EVEN ACCOUNTING FOR MHO
- INTRINSIC-LIKE, VALENCE-LIKE BUMP AT LARGE x

IS IT INTRINSIC CHARM?

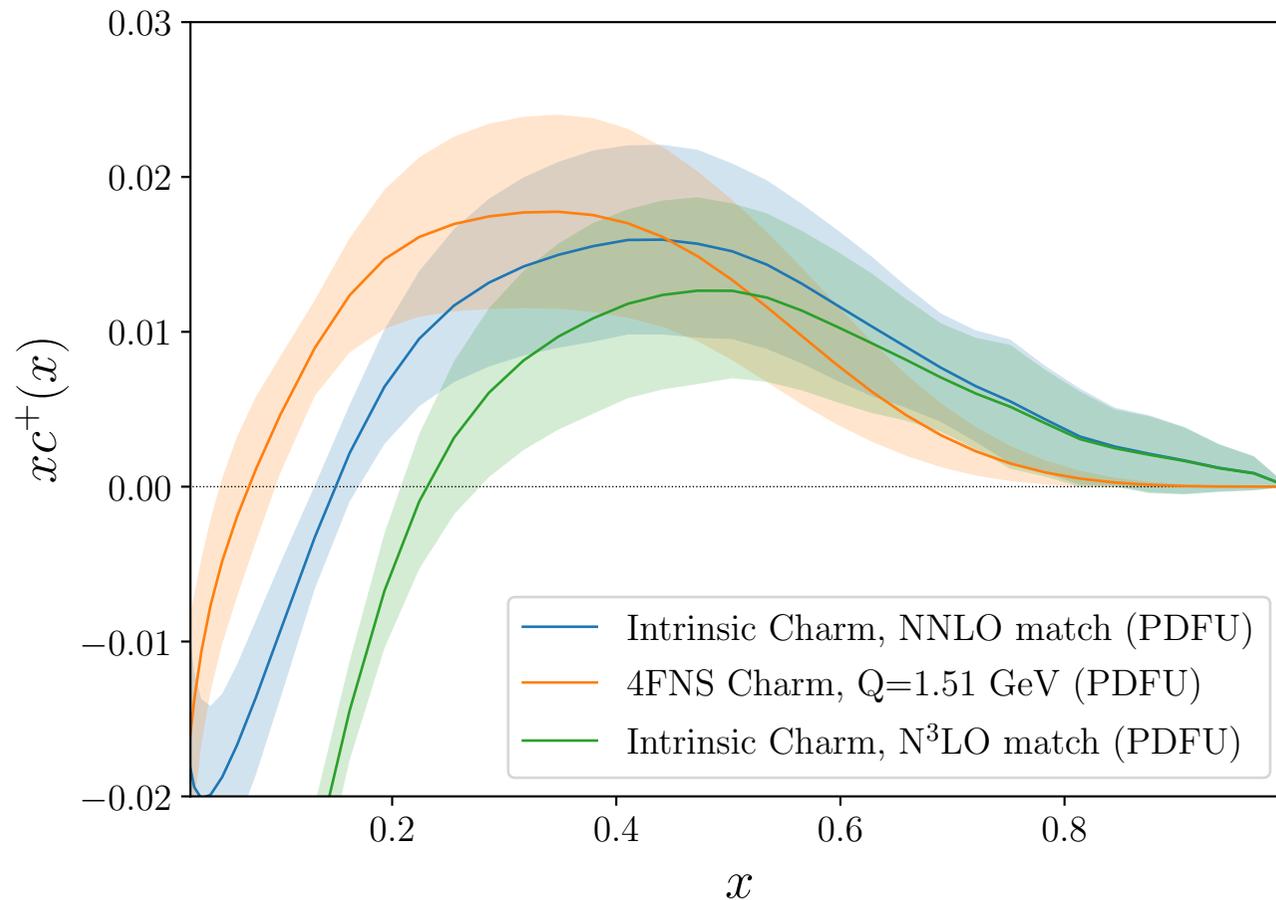

RECALL LARGE & PERTURBATIVELY UNSTABLE CONVERSION TO $N_f = 3$ SCHEME

INTRINSIC CHARM....

THE **EKO** CODE (Candido, Hekhorn, Magni, 2022)

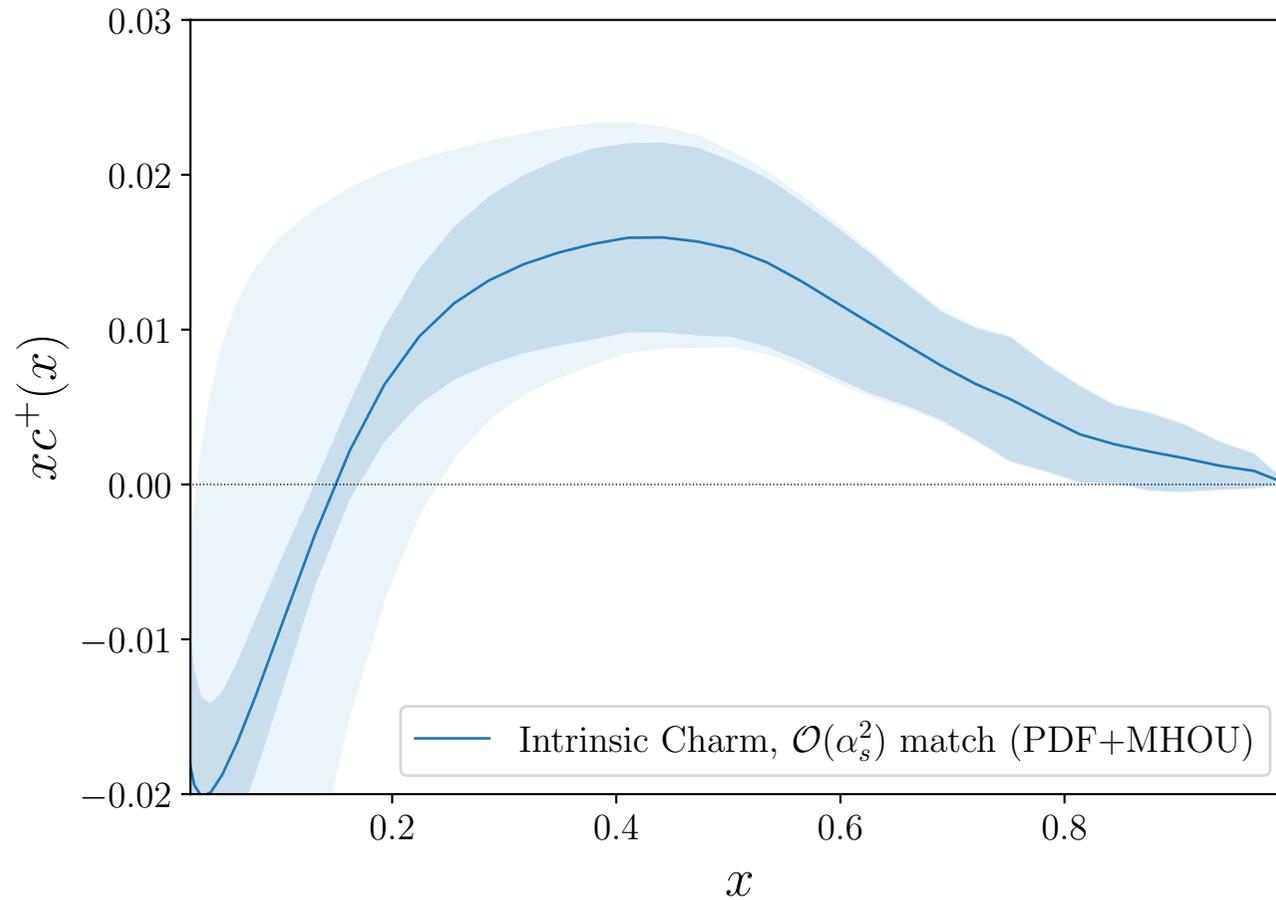

- IMPLEMENTS **DIRECT & INVERSE** EVOLUTION & MATCHING
- **N³LO MATCHING** (Blümlein, Ablinger et al.) ALSO IMPLEMENTED

CHARM PDF: $N_f = 4$ VS $N_f = 3$ (NNLO & N³LO CONVERSION)

INTRINSIC CHARM!

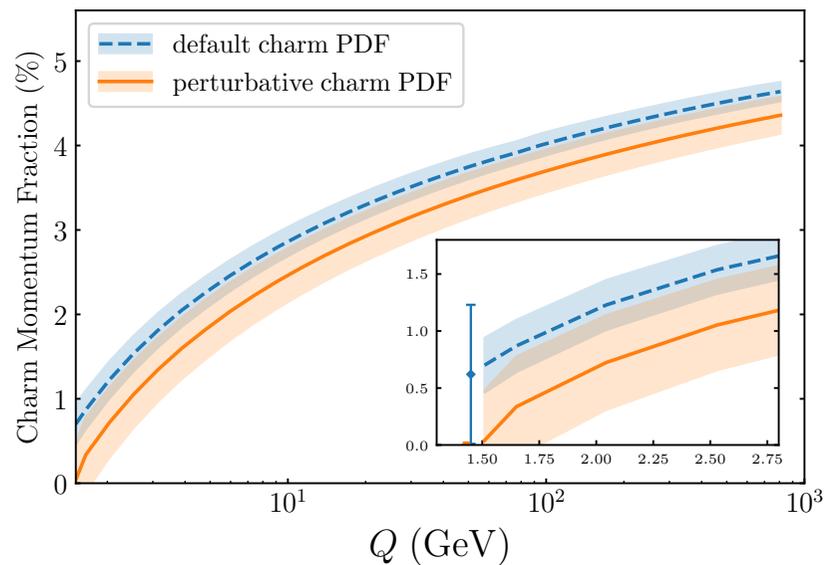

- M³HOU ESTIMATED FROM N³LO-NNLO DIFFERENCE
 - LARGE UNCERTAINTY AT SMALL x
 - NEGLIGIBLE UNCERTAINTY IN VALENCE REGION
- COMPATIBLE WITH ZERO AT SMALL x
- CLEAR EVIDENCE FOR INTRINSIC VALENCE PEAK

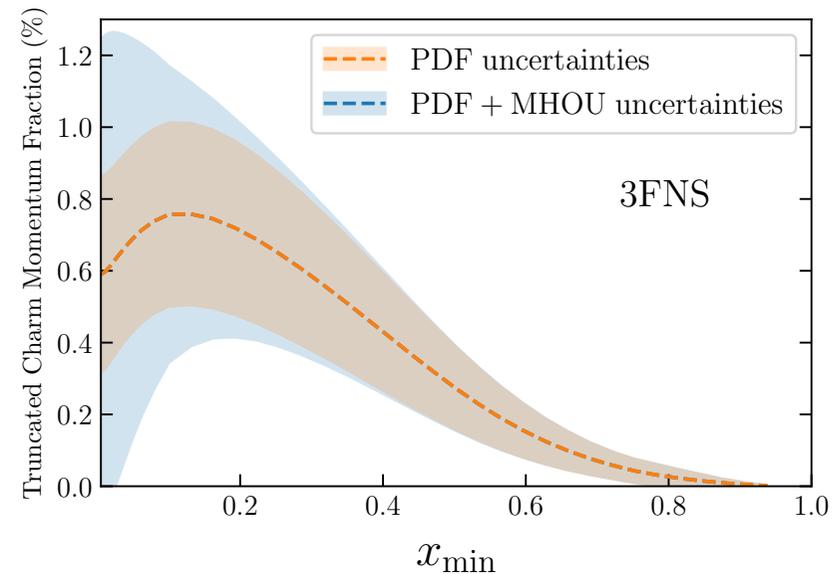

THE CHARM MOMENTUM FRACTION

- $n_f = 4$, $Q = 1.65$ GeV: **FITTED** $\langle c \rangle = 0.87 \pm 0.23_{\text{pdf}}\%$ vs.
PERTURBATIVE $\langle c \rangle = 0.346 \pm 0.005_{\text{pdf}} \pm 0.44_{\text{mhou}}\%$
- $n_f = 3$, **FITTED** $\langle c \rangle = 0.62 \pm 0.28_{\text{pdf}} \pm 0.54_{\text{mhou}}\%$ vs.
PERTURBATIVE $\langle c \rangle = 0\%$

$n_f = 4$: FITTED VS. PERTURBATIVE

$n_f = 3$: MOMENTUM INTEGRAL

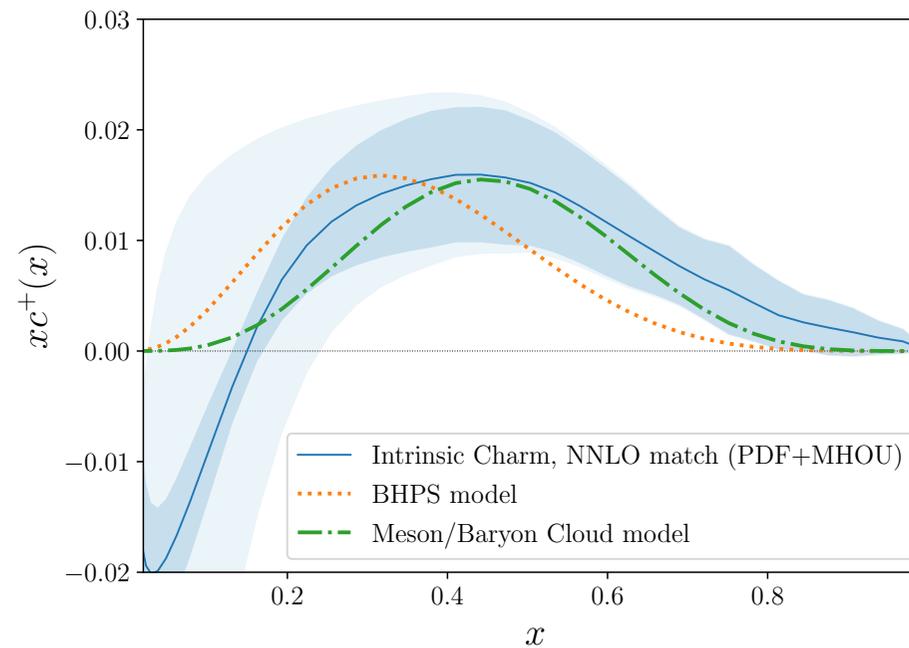

- $n_f = 4$ MOMENTUM FRACTION **DETERMINED TO GOOD ACCURACY**
- **LARGE MHOu** AT SMALL $x \Rightarrow$ **TOTAL INTRINSIC** MOMENTUM FRACTION **COMPATIBLE WITH ZERO**

MODELS
