

Fragmentation Functions of light charged hadrons

Particle Physics Theory seminar

Emanuele R. Nocera

School of Physics and Astronomy - University of Edinburgh

Higgs Centre for Theoretical Physics – 8th November 2017

One slide to introduce myself

Personal path

- ① Born in Aosta, Italy
- ② Ms.Sc. (Torino, 2010), Ph.D. (Milano, 2014), PD (Genova, 2014; Oxford, 2015)
- ③ Joined the University of Edinburgh as a PDRA since 10/2017 - I'm sitting in JCMB, 4421

Research interests & activity

- ① Parton distributions functions for LHC phenomenology
I work as a member of the NNPDF collaboration
- ② Spin physics and 3D-imaging of the proton
how do quarks and gluons contribute to the proton spin?
- ③ The hadronisation of partons
how do quarks and gluons fragment into final-state particles?
- ④ Nonperturbative models of nucleon structure and their interplay with perturbative QCD
can we learn something about the nucleon structure from nuclear models?

Outline

① Fragmentation Functions: the basics

- ▶ factorisation, evolution
- ▶ FF fits: why should we bother?

② Methodological interlude

- ▶ parametrisation: standard vs redundant
- ▶ uncertainty representation: Hessian vs Monte Carlo
- ▶ parameter optimisation, methodology validation

③ The NNFF1.0 analysis

- ▶ data set and fit settings
- ▶ results: fit quality, perturbative stability, dependence on the data set/kinematic cuts

④ Summary and outlook

- ▶ global fits, simultaneous fits

DISCLAIMER

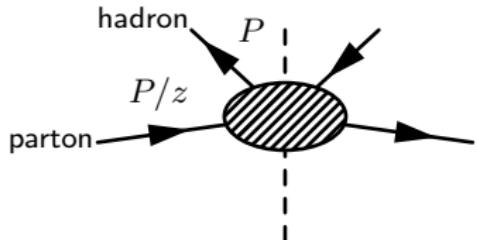

This is not a review talk on Fragmentation Functions
Focus on topics which I've worked on recently

[JHEP 1503 (2015) 046; EPJ C77 (2017) 516; arXiv:1709.03400]

1. Fragmentation Functions: the basics

Hadrons in the final state: Fragmentation Functions

FFs allow for a proper field-theoretic definition as matrix elements of bilocal operators

collinear transition
of a massless parton i
into a massless hadron h
with fractional momentum z

no local OPE \implies no lattice formulation

[Rev.Mod.Phys. 67 (1995) 157]

$$D_i^h(z) = \frac{1}{12\pi} \sum_X \int dy^- e^{-i\frac{P^+}{z}y^-} \text{Tr} [\gamma^+ \langle 0 | \psi(y) \mathcal{P} | h(P) X \rangle \langle h(P) X | \mathcal{P}' \bar{\psi}(0) | 0 \rangle]$$

with light-cone coordinates and appropriate gauge links $\mathcal{P}, \mathcal{P}'$

$$y = (y^+, y^-, \mathbf{y}_\perp), \quad y^+ = (y^0 + y^z)/\sqrt{2}, \quad y^- = (y^0 - y^z)/\sqrt{2}, \quad \mathbf{y}_\perp = (v^x, v^y)$$

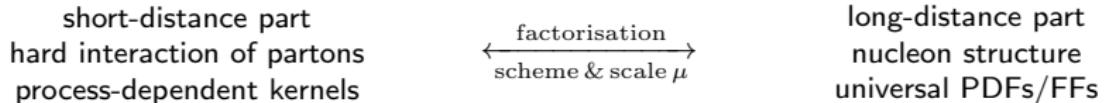

All these definitions have ultraviolet divergences which must be renormalised
in order to define finite FFs to be used in the factorisation formulas
(FFs, like PDFs, are scheme dependent)

The definition above can be generalised to include longitudinal/transverse polarisations

Factorisation of physical observables

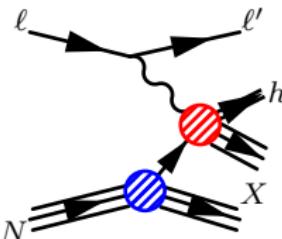

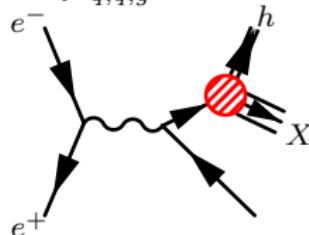

[Adv.Ser.Direct.HEP 5 (1988) 1]

- ① A variety of sufficiently inclusive processes allow for a factorised description

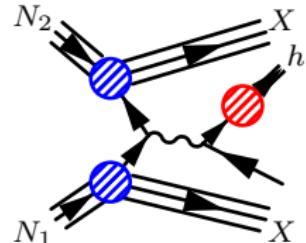

- ② Physical observables are written as a convolution of coefficient functions and FFs

$$\mathcal{O}_I = \sum_{i=q,\bar{q},g} C_{Ii}(y, \alpha_s(\mu^2)) \otimes D_i(y, \mu^2) + \text{p.s. corrections}$$

$$f \otimes g = \int_x^1 \frac{dy}{y} f\left(\frac{x}{y}\right) g(y)$$

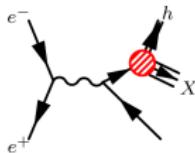

- ③ Coefficient functions allow for a perturbative expansion

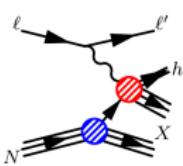

$$C_{If}(y, \alpha_s) = \sum_{k=0} a_s^k C_{If}^{(k)}(y), \quad a_s = \alpha_s/(4\pi)$$

- ④ After factorisation, all quantities (including FFs) depend on μ

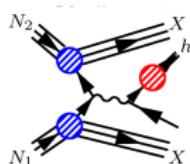

Factorisation of physical observables

$e^+ + e^- \rightarrow h + X$
single-inclusive
annihilation (SIA)

$\ell + N \rightarrow \ell' + h + X$
semi-inclusive deep-
inelastic scattering (SIDIS)

$N_1 + N_2 \rightarrow h + X$
high- p_T hadron production
in pp collisions (PP)

$$\frac{d\sigma^h}{dz} = F_T^h(z, Q^2) + F_L^h(z, Q^2) = F_2^h(x, Q^2)$$

$$F_{k=T,L,2}^h = \frac{4\pi\alpha_{\text{em}}^2}{Q^2} \langle e^2 \rangle \left\{ D_\Sigma^h \otimes C_{k,q}^S + n_f D_g^h \otimes C_{k,g}^S + D_{\text{NS}}^h \otimes C_{k,q}^{\text{NS}} \right\}$$

up to NNLO [PLB 386 (1996) 422; NPB 487 (1997) 233; PLB 392 (1997) 207]

$$\frac{d\sigma^h}{dxdydz} = \frac{2\pi\alpha_{\text{em}}^2}{Q^2} \left[\frac{1+(1-y)^2}{y} 2F_1^h + \frac{2(1-y)}{y} F_L^h \right]$$

$$2F_1^h = e_q^2 \left\{ q \otimes D_q^h + \frac{\alpha_s}{2\pi} \left[q \otimes C_{qq}^1 \otimes D_q^h + q \otimes C_{gq}^1 \otimes D_g^h + g \otimes C_{qg}^1 \otimes D_q^h \right] \right\}$$

$$F_L^h = \frac{\alpha_s}{2\pi} \sum_{q,\bar{q}} e_q^2 \left[q \otimes C_{qq}^L \otimes D_q^h + q \otimes C_{gq}^L \otimes D_g^h + g \otimes C_{qg}^L \otimes D_q^h \right]$$

up to NLO [NPB 160 (1979) 301; PRD 57 (1998) 5811]
partial NNLO [PRD 95 (2017) 034027]

$$E_h \frac{d^3\sigma}{dp_h^3} = \sum_{a,b,c} f_a \otimes f_b \otimes \hat{\sigma}_{ab}^c \otimes D_c^h$$

$$\sum_{i,j,k} \int \frac{dx_a}{x_a} \int \frac{dx_b}{x_b} \int \frac{dz}{z^2} f^{i/p_a}(x_a) f^{j/p_b}(x_b) D^{h/k}(z) \hat{\sigma}^{ij \rightarrow k} \delta(\hat{s} + \hat{t} + \hat{u})$$

up to NLO [PRD 67 (2003) 054004; PRD 67 (2003) 054005]

Evolution of FFs: DGLAP equations [NPB 126 (1977) 298]

- ① A set of $(2n_f + 1)$ integro-differential equations (n_f =number of active flavours)

$$\frac{\partial}{\partial \ln \mu^2} D_i(x, \mu^2) = \sum_j^{n_f} \int_x^1 \frac{dz}{z} P_{ji}(z, \alpha_s(\mu^2)) D_j\left(\frac{x}{z}, \mu^2\right)$$

- ② Often written in a convenient basis of FFs

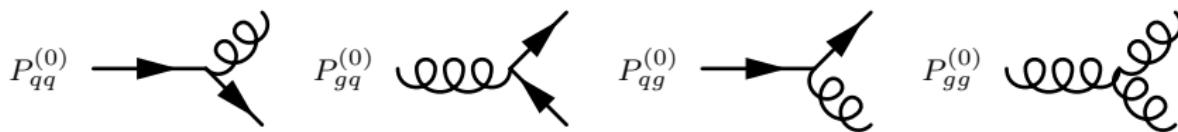

$$D_{NS;\pm} = (D_q \pm D_{\bar{q}}) - (D_{q'} \pm D_{\bar{q}'}) \quad D_{NS;v} = \sum_q^{n_f} (D_q - D_{\bar{q}}) \quad D_{\Sigma} = \sum_q^{n_f} (D_q + D_{\bar{q}})$$

$$\frac{\partial}{\partial \ln \mu^2} D_{NS;\pm,v}(x, \mu^2) = P^{\pm,v}(x, \mu_F^2) \otimes D_{NS;\pm,v}(x, \mu^2)$$

$$\frac{\partial}{\partial \ln \mu^2} \begin{pmatrix} D_{\Sigma}(x, \mu^2) \\ D_g(x, \mu^2) \end{pmatrix} = \begin{pmatrix} P^{qq} & 2n_f P^{gq} \\ \frac{1}{2n_f} P^{qg} & P^{gg} \end{pmatrix} \otimes \begin{pmatrix} D_{\Sigma}(x, \mu^2) \\ D_g(x, \mu^2) \end{pmatrix}$$

- ③ With perturbative computable (time-like) splitting functions

$$P_{ji}(z, \alpha_s) = \sum_{k=0}^{k+1} a_s^{k+1} P_{ji}^{(k)}(z), \quad a_s = \alpha_s/(4\pi)$$

Splitting functions: LO and NLO

$$P_{\text{as}}^{(0)}(x) = \textcolor{blue}{C_F}(2p_{qq}(x) + 3\delta(1-x))$$

$$P_{\text{ps}}^{(0)}(x) = 0$$

$$P_{\text{qg}}^{(0)}(x) = 2\textcolor{blue}{n_f} p_{qg}(x)$$

$$P_{\text{gg}}^{(0)}(x) = 2\textcolor{blue}{C_F} p_{gg}(x)$$

$$P_{\text{gg}}^{(0)}(x) = \textcolor{blue}{C_A} \left(4p_{gg}(x) + \frac{11}{3}\delta(1-x) \right) - \frac{2}{3}\textcolor{blue}{n_f}\delta(1-x)$$

LO: 1973

$$\begin{aligned} P_{\text{as}}^{(1)+}(x) &= 4\textcolor{blue}{C_A}\textcolor{blue}{C_F} \left(p_{qq}(x) \left[\frac{67}{18} - \zeta_2 + \frac{11}{6}H_0 + H_{0,0} \right] + p_{qq}(-x) \left[\zeta_2 + 2H_{-1,0} - H_{0,0} \right] \right. \\ &\quad \left. + \frac{14}{3}(1-x) + \delta(1-x) \left[\frac{17}{24} + \frac{11}{3}\zeta_2 - 3\zeta_3 \right] \right) - 4\textcolor{blue}{C_F}\textcolor{blue}{n_f} \left(p_{qg}(x) \left[\frac{5}{9} + \frac{1}{3}H_0 \right] + \frac{2}{3}(1-x) \right. \\ &\quad \left. + \delta(1-x) \left[\frac{1}{12} + \frac{2}{3}\zeta_2 \right] \right) + 4\textcolor{blue}{C_F}^2 \left(2p_{qq}(x) \left[H_{1,0} - \frac{3}{4}H_0 + H_2 \right] - 2p_{qq}(-x) \left[\zeta_2 + 2H_{-1,0} \right. \right. \\ &\quad \left. \left. - H_{0,0} \right] - (1-x) \left[1 - \frac{3}{2}H_0 \right] - H_0 - (1+x)H_{0,0} + \delta(1-x) \left[\frac{3}{8} - 3\zeta_2 + 6\zeta_3 \right] \right) \\ P_{\text{as}}^{(1)-}(x) &= P_{\text{as}}^{(1)+}(x) + 16\textcolor{blue}{C_F} \left(\textcolor{blue}{C_F} - \frac{\textcolor{blue}{C_A}}{2} \right) \left(p_{qq}(-x) \left[\zeta_2 + 2H_{-1,0} - H_{0,0} \right] - 2(1-x) \right. \\ &\quad \left. - (1+x)H_0 \right) \end{aligned}$$

$$\begin{aligned} P_{\text{gg}}^{(1)}(x) &= 4\textcolor{blue}{C_A}\textcolor{blue}{n_f} \left(1 - x - \frac{10}{9}p_{gg}(x) - \frac{13}{9} \left(\frac{1}{x} - x^2 \right) - \frac{2}{3}(1+x)H_0 - \frac{2}{3}\delta(1-x) \right) + 4\textcolor{blue}{C_A}^2 \left(27 \right. \\ &\quad \left. + (1+x) \left[\frac{11}{3}H_0 + 8H_{0,0} - \frac{27}{2} \right] + 2p_{gg}(-x) \left[H_{0,0} - 2H_{-1,0} - \zeta_2 \right] - \frac{67}{9} \left(\frac{1}{x} - x^2 \right) - 12H_0 \right. \\ &\quad \left. - \frac{44}{3}x^2H_0 + 2p_{gg}(x) \left[\frac{67}{18} - \zeta_2 + H_{0,0} + 2H_{1,0} + 2H_2 \right] + \delta(1-x) \left[\frac{8}{3} + 3\zeta_3 \right] \right) + 4\textcolor{blue}{C_F}\textcolor{blue}{n_f} \left(2H_0 \right. \\ &\quad \left. + \frac{2}{3}\frac{1}{x} + \frac{10}{3}x^2 - 12 + (1+x) \left[4 - 5H_0 - 2H_{0,0} \right] \right) \end{aligned}$$

NLO: 1980

Splitting functions: NNLO

$$\begin{aligned} F_{12}^{(2)}(x) = & -315\pi^2 x^2 y_2 \left(\frac{15}{2}y_1^2 y_2 - 45y_1 y_2 + 375y_1^3 y_2 - 75y_1^5 y_2 + 225y_1^7 y_2 + \frac{15}{2}y_1^9 y_2 + 5y_1 y_2^3 + 375y_1^3 y_2^3\right. \\ & - 45y_1^5 y_2^3 + 225y_1^7 y_2^3 - 75y_1^9 y_2^3 + 3y_1^3 y_2^5 - 45y_1^5 y_2^5 + 45y_1^7 y_2^5 - 3y_1^9 y_2^5 + 3y_1 y_2^7 \\ & - 45y_1^3 y_2^7 + 45y_1^5 y_2^7 - 45y_1^7 y_2^7 + 3y_1^9 y_2^7 + 3y_1^3 y_2^9 - 45y_1^5 y_2^9 + 45y_1^7 y_2^9 - 3y_1^9 y_2^9 + 3y_1 y_2^{11} \\ & \left. - 45y_1^3 y_2^{11} + 45y_1^5 y_2^{11} - 45y_1^7 y_2^{11} + 3y_1^9 y_2^{11}\right) + 175\pi^2 x^4 y_2 \left(\frac{15}{2}y_1^2 y_2 - 45y_1 y_2 + 375y_1^3 y_2 - 75y_1^5 y_2 + 225y_1^7 y_2 + \frac{15}{2}y_1^9 y_2 + 5y_1 y_2^3 + 375y_1^3 y_2^3\right. \\ & - 45y_1^5 y_2^3 + 225y_1^7 y_2^3 - 75y_1^9 y_2^3 + 3y_1^3 y_2^5 - 45y_1^5 y_2^5 + 45y_1^7 y_2^5 - 3y_1^9 y_2^5 + 3y_1 y_2^7 \\ & - 45y_1^3 y_2^7 + 45y_1^5 y_2^7 - 45y_1^7 y_2^7 + 3y_1^9 y_2^7 + 3y_1^3 y_2^9 - 45y_1^5 y_2^9 + 45y_1^7 y_2^9 - 3y_1^9 y_2^9 + 3y_1 y_2^{11} \\ & \left. - 45y_1^3 y_2^{11} + 45y_1^5 y_2^{11} - 45y_1^7 y_2^{11} + 3y_1^9 y_2^{11}\right) + 315\pi^2 x^6 y_2 \left(\frac{15}{2}y_1^2 y_2 - 45y_1 y_2 + 375y_1^3 y_2 - 75y_1^5 y_2 + 225y_1^7 y_2 + \frac{15}{2}y_1^9 y_2 + 5y_1 y_2^3 + 375y_1^3 y_2^3\right. \\ & - 45y_1^5 y_2^3 + 225y_1^7 y_2^3 - 75y_1^9 y_2^3 + 3y_1^3 y_2^5 - 45y_1^5 y_2^5 + 45y_1^7 y_2^5 - 3y_1^9 y_2^5 + 3y_1 y_2^7 \\ & - 45y_1^3 y_2^7 + 45y_1^5 y_2^7 - 45y_1^7 y_2^7 + 3y_1^9 y_2^7 + 3y_1^3 y_2^9 - 45y_1^5 y_2^9 + 45y_1^7 y_2^9 - 3y_1^9 y_2^9 + 3y_1 y_2^{11} \\ & \left. - 45y_1^3 y_2^{11} + 45y_1^5 y_2^{11} - 45y_1^7 y_2^{11} + 3y_1^9 y_2^{11}\right). \end{aligned}$$

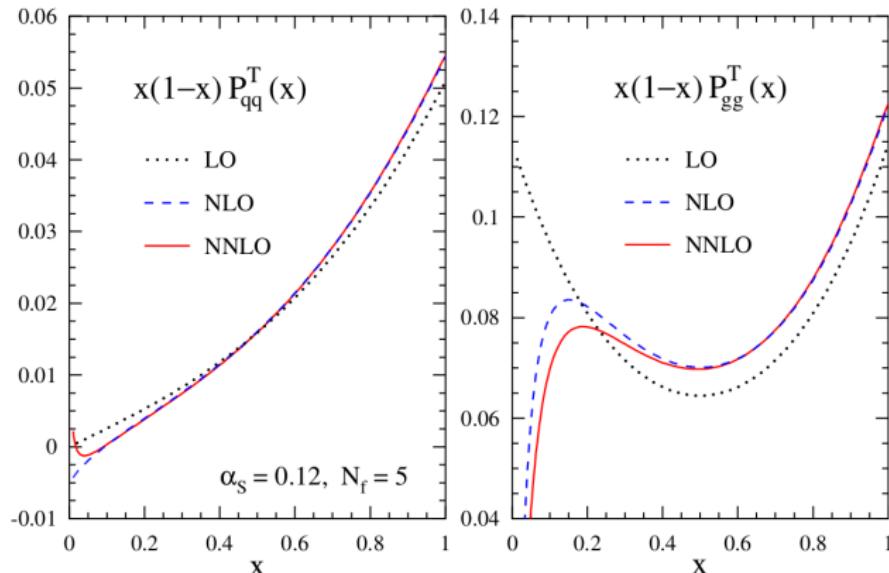

Emanuele R. Nocera (Edinburgh)

FFs of light charged hadrons

8th November 2017

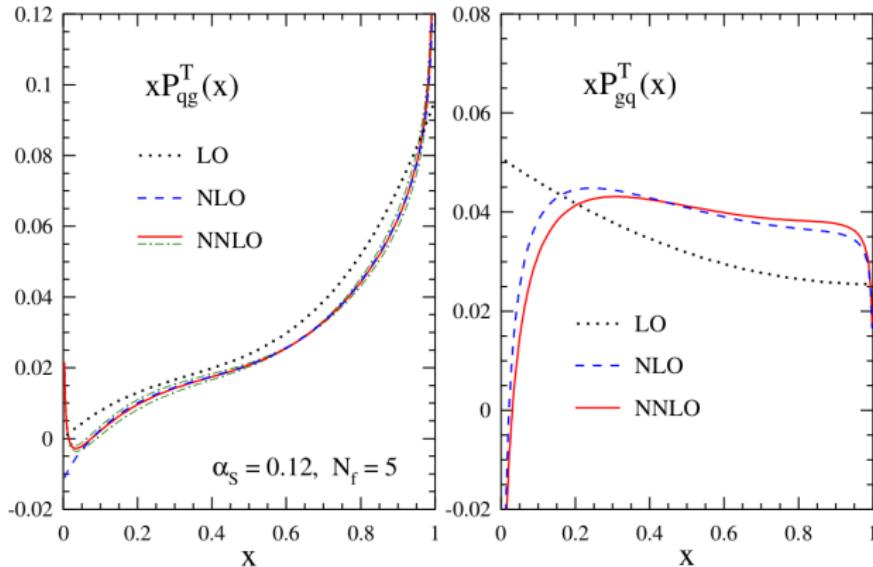

Properties of splitting functions

- ① At LO [Sov. J. Nucl. Phys. 15 (1973) 438; NPB 126 (1977) 298; NPB 136 (1978) 445]
time-like and space-like splitting functions are equal, provided $P_{qg}^{S,(0)} \leftrightarrow P_{gg}^{T,(0)}$
- ② At NLO [NPB 175 (1980) 27, PLB 97 (1980) 497, PRD 48 (1993) 116]
time-like and space-like splitting functions are related by analytic continuation
- ③ at NNLO [PLB 638 (2006) 61, PLB 659 (2008) 290, NPB 854 (2012) 133]
an uncertainty still remains on the exact form of $P_{qg}^{(2)}$ (it does not affect its log behavior)

Properties of splitting functions

- ① At LO [Sov. J. Nucl. Phys. 15 (1973) 438; NPB 126 (1977) 298; NPB 136 (1978) 445]
time-like and space-like splitting functions are equal, provided $P_{qg}^{S,(0)} \leftrightarrow P_{gq}^{T,(0)}$
- ② At NLO [NPB 175 (1980) 27, PLB 97 (1980) 497, PRD 48 (1993) 116]
time-like and space-like splitting functions are related by analytic continuation
- ③ at NNLO [PLB 638 (2006) 61, PLB 659 (2008) 290, NPB 854 (2012) 133]
an uncertainty still remains on the exact form of $P_{qg}^{(2)}$ (it does not affect its log behavior)

Properties of splitting functions

Must be careful with fixed-order splitting functions as $z \rightarrow 0$ ($m = 1, \dots, 2k + 1$)

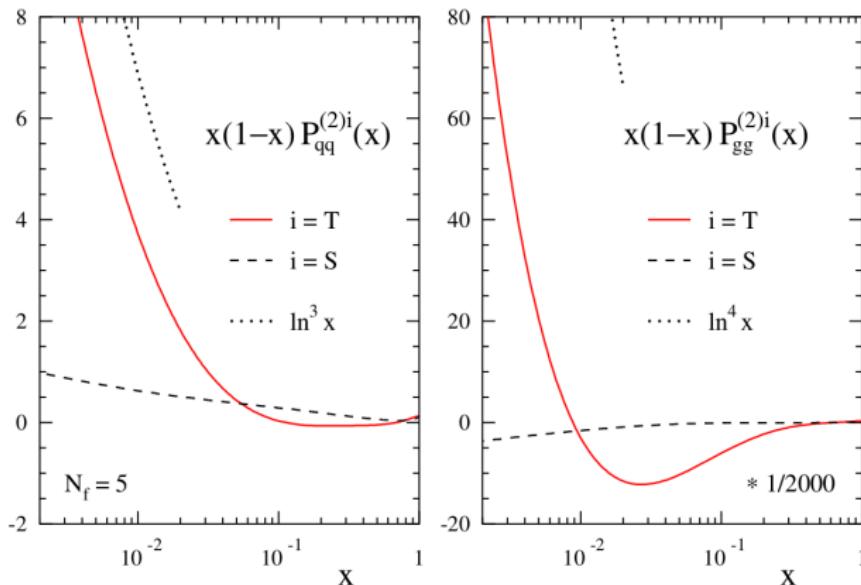

SPACE-LIKE CASE

$$P_{ji} \propto \frac{a_s^{k+1}}{x} \log^{k+1-m} \frac{1}{x}$$

TIME-LIKE CASE

$$P_{ji} \propto \frac{a_s^{k+1}}{z} \log^{2(k+1)-m-1} z$$

Soft gluon logarithms diverge more rapidly in the TL case than in the SL case: as z decreases, the unresummed SGLs spoil the convergence of the FO series for $P(z, a_s)$ if $\log \frac{1}{z} \geq \mathcal{O}(a_s^{-1/2})$

Properties of splitting functions

Must be careful with fixed-order splitting functions as $z \rightarrow 0$ ($m = 1, \dots, 2k + 1$)

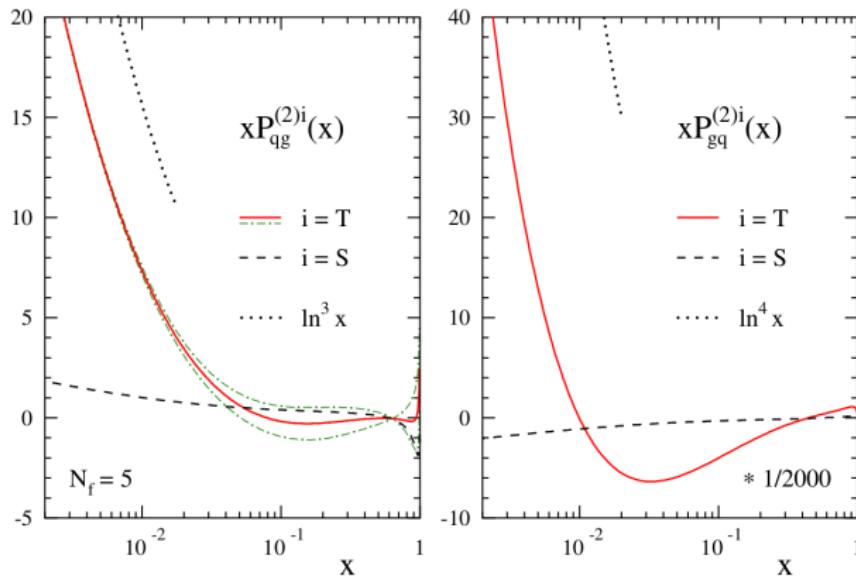

SPACE-LIKE CASE

$$P_{ji} \propto \frac{a_s^{k+1}}{x} \log^{k+1-m} \frac{1}{x}$$

TIME-LIKE CASE

$$P_{ji} \propto \frac{a_s^{k+1}}{z} \log^{2(k+1)-m-1} z$$

Soft gluon logarithms diverge more rapidly in the TL case than in the SL case: as z decreases, the unresummed SGLs spoil the convergence of the FO series for $P(z, a_s)$ if $\log \frac{1}{z} \geq \mathcal{O}(a_s^{-1/2})$

Theoretical constraints

1 Momentum sum rule

$$\sum_h \int_0^1 dz z D_i^h(z, \mu^2) = 1 \quad \forall \text{ parton } i$$

2 Charge sum rule

$$\sum_h \int_0^1 dz e_h D_i^h(z, \mu^2) = e_i \quad \forall \text{ parton } i$$

where $e_{h(i)}$ is the electric charge of the hadron h (parton i)

3 Charge conjugation symmetry

$$D_{q(\bar{q})}^{h+} = D_{\bar{q}(q)}^{h-} \quad D_g^{h+} = D_g^{h-} \quad \forall \text{ hadron species } h^\pm$$

4 Isospin symmetry of the strong interaction

$$D_u^{\pi+} = D_d^{\pi-} \quad D_d^{\pi+} = D_u^{\pi-}$$

approximate, as $m_u \sim m_d$, but no phenomenological evidences of violation

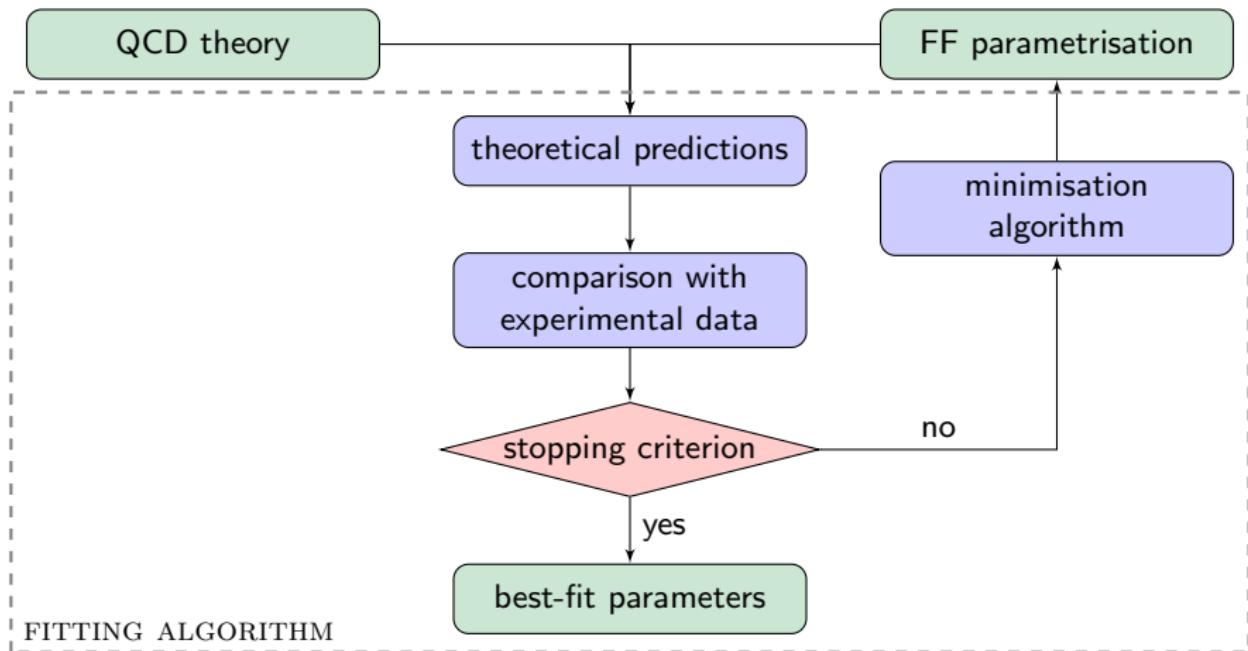

5 Positivity of cross sections

implies that FFs should be positive-definite at LO

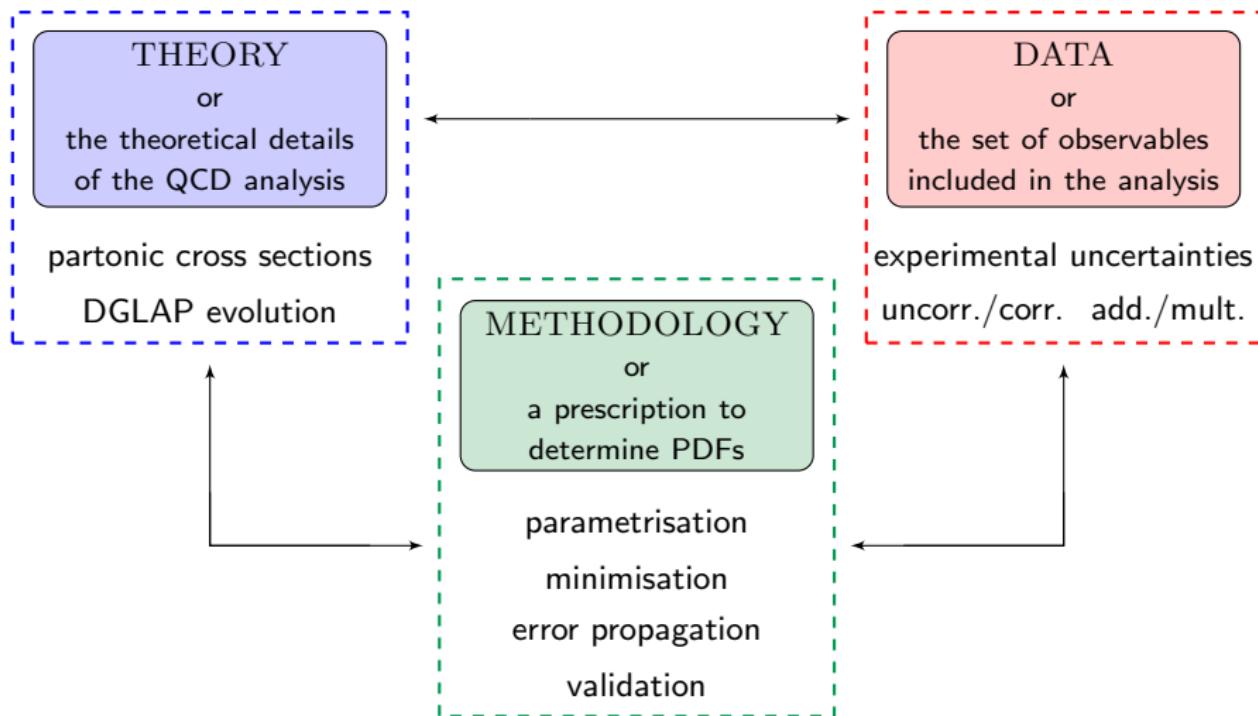

Determining FFs from data: a (global) QCD analysis

Determine the probability density $\mathcal{P}[D]$ in the space of FFs $[D]$

$$\langle \mathcal{O}[D] \rangle = \int \mathcal{D}D \mathcal{P}[D] \mathcal{O}[D] \quad \sigma_{\mathcal{O}}[D] = \left[\int \mathcal{D}D \mathcal{P}[D] (\mathcal{O}[D] - \langle \mathcal{O}[D] \rangle)^2 \right]^{1/2}$$

A global QCD analysis: the ingredients we need

Each of these ingredients is a source of uncertainty in the FF determination

Available FF sets (status 2017)

LSS15 [PRD 96 (2016) 074026]	SIDIS only

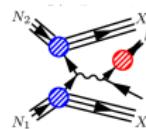

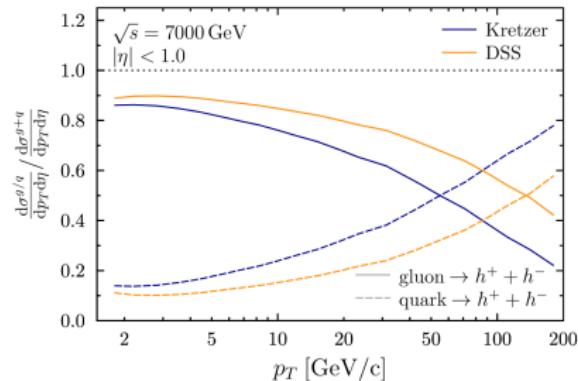

Focus on π and K which constitute the largest fraction in measured yields

Fragmentation functions: why should we bother?

Example 1: Ratio of the inclusive charged-hadron spectra measured by CMS and ALICE

Figures taken from [NPB 883 (2014) 615]

$$E \frac{d^3 \sigma}{dp_T^3} = \sum_{a,b,c} f_a \otimes f_b \otimes \hat{\sigma}_{ab}^c \otimes D_c^h$$

Predictions from all available FF sets are not compatible with CMS and ALICE data, not even within scale and PDF/FF uncertainties
 → How well do we know the gluon FF?

Fragmentation functions: why should we bother?

Example 2: The strange polarised parton distribution at $Q^2 = 2.5 \text{ GeV}^2$ ($\Delta s = \Delta \bar{s}$)

NNPDFpol1.0 [NPB 874 (2013) 36]
 $\int_0^1 dx [\Delta s + \Delta \bar{s}] = -0.13 \pm 0.09$

JAM17 [PRL 119 (2017) 132001]
 $\int_0^1 dx [\Delta s + \Delta \bar{s}] = -0.03 \pm 0.10$

First moment constrained by
 $a_3 = \int_0^1 dx [\Delta u^+ - \Delta d^+] = 1.2701 \pm 0.0025$

$a_8 = \int_0^1 dx [\Delta u^+ + \Delta d^+ - 2\Delta s^+] = 0.585 \pm 0.176$

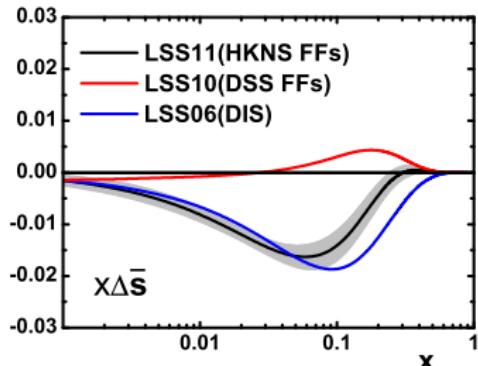

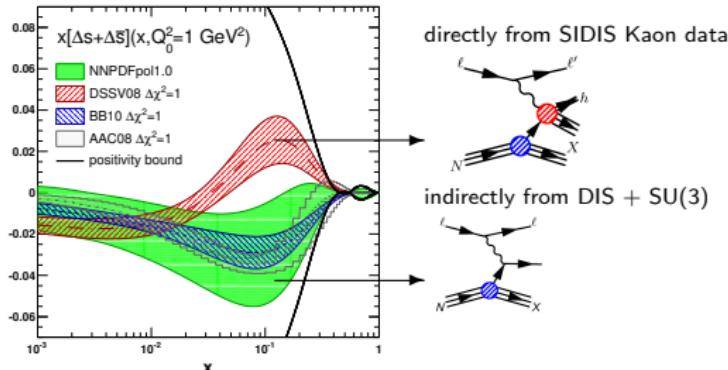

Figure taken from [PRD D84 (2011) 014002]

$$\frac{d\sigma}{dxdy} = \frac{2\pi\alpha_{\text{em}}^2}{Q^2} [(2-y)g_1]$$

$$\frac{d\sigma^h}{dxdydz} = \frac{2\pi\alpha_{\text{em}}^2}{Q^2} \left[\frac{1+(1-y)^2}{y} 2g_1^h + \frac{2(1-y)}{y} g_L^h \right]$$

If SIDIS data is used to determine Δs , K^\pm FFs for different sets lead to different results. Such results may differ significantly among them and w.r.t. the results obtained from DIS
→ How well do we know kaon FFs?

2. Methodological interlude

Parametrisation: two alternative choices

$$zD_i^h(z, Q_0^2) = z^{a_i^h} (1-z)^{b_i^h} \mathcal{F}_i^h(z, \{\mathbf{c}\})$$

- ① Standard parametrisation, e.g.

$$\mathcal{F}_i^h(z, \{\mathbf{c}\}) = \frac{1 + \gamma_i^h (1-z)^{\delta_i^h}}{B[2 + a_i^h, b_i^h + 1] + \gamma_i^h B[2 + a_i^h, b_i^h + \delta_i^h + 1]}$$

in terms of a (relatively) small set of parameters ($\mathcal{O}(30)$ per PDF set)

$$\{\mathbf{a}\} = \{a_i^h, b_i^h\} \cup \{\mathbf{c}\} = \{a_i^h, b_i^h, \gamma_i^h, \delta_i^h\}$$

- ⇒ smooth behavior (a desirable feature for a PDF)
- ⇒ potential source of bias if the parametrisation is too rigid

- ② Redundant parametrisation, e.g.

$\mathcal{F}_i^h(z, \{\mathbf{c}\})$ is a neural network

in terms of a huge set of parameters ($\mathcal{O}(200)$ per PDF set)

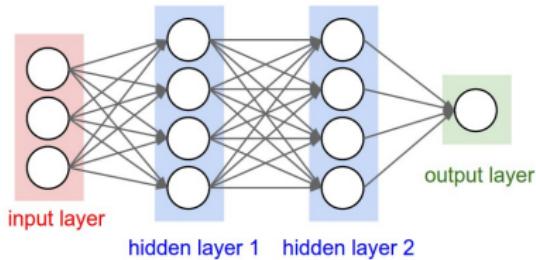

$$\{\mathbf{a}\} = \{\omega_{ij}^{(L-1), f_i^h}, \theta_i^{(L), f_i^h}\}$$

- ⇒ potentially non-smooth
- ⇒ bias due to the parametrisation reduced as much as possible

Parametrisation: what a neural network exactly is?

A convenient **functional form** providing a **flexible** parametrization used as a generator of random functions in the FF space

EXAMPLE: MULTI-LAYER FEED-FORWARD PERCEPTRON

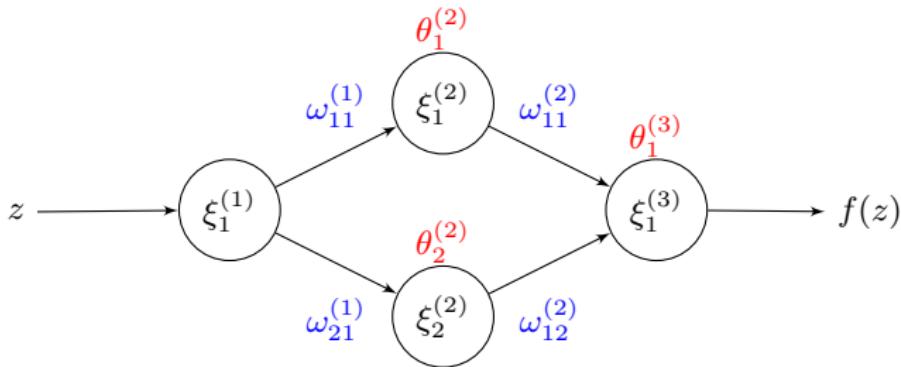

$$\xi_i^{(l)} = g \left(\sum_j^{n_l-1} \omega_{ij}^{(l-1)} \xi_j^{(l-1)} - \theta_i^{(l)} \right)$$

$$g(y) = \frac{1}{1 + e^{-y}}$$

- made of neurons grouped into layers (define the architecture)
- each neuron receives input from neurons in the preceding layer (feed-forward NN)
- activation $\xi_i^{(l)}$ determined by a set of parameters (**weights** and **thresholds**)
- activation determined according to a **non-linear function** (except the last layer)

Parametrisation: what a neural network exactly is?

EXAMPLE: THE SIMPLEST 1-2-1 MULTI-LAYER FEED-FORWARD PERCEPTRON

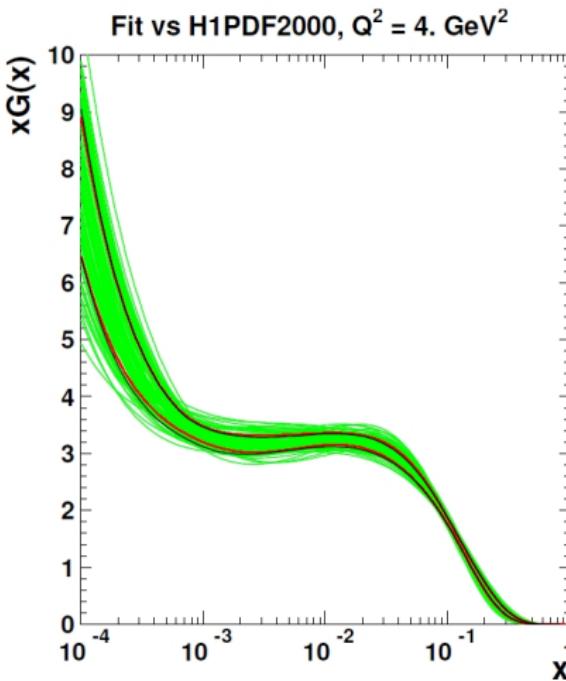

$$f(z) \equiv \xi_1^{(3)} = \left\{ 1 + \exp \left[\theta_1^{(3)} - \frac{\omega_{11}^{(2)}}{1 + e^{\theta_1^{(2)} - x\omega_{11}^{(1)}}} - \frac{\omega_{12}^{(2)}}{1 + e^{\theta_2^{(2)} - x\omega_{21}^{(1)}}} \right] \right\}^{-1}$$

Recall:

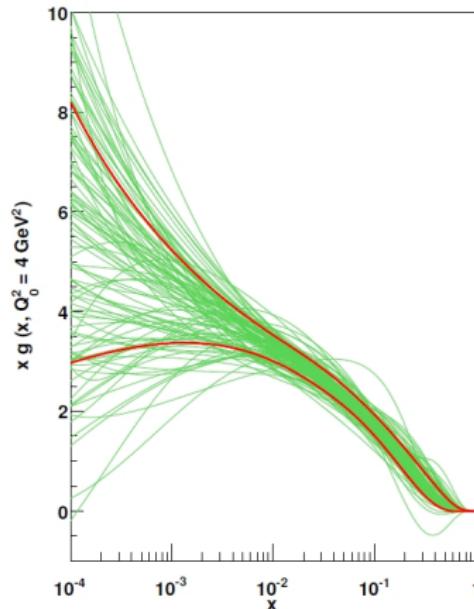

$$\xi_i^{(l)} = g \left(\sum_j^{n_l-1} \omega_{ij}^{(l-1)} \xi_j^{(l-1)} - \theta_i^{(l)} \right) ; \quad g(z) = \frac{1}{1 + e^{-z}}$$

Parametrisation: standard vs redundant

HERA-LHC 2009 PDF benchmark

simple parametrization

redundant parametrization (NN)

Parameter optimisation

Optimisation usually performed by means of simple gradient descent:
compute and minimise the gradient of the fit quality with respect to the fit parameters

$$\frac{\partial \chi^2}{\partial a_i}, \quad \text{for } i = 1, \dots, N_{\text{par}} \quad \chi^2 = \sum_{i,j}^{N_{\text{dat}}} (T_i[\{\mathbf{a}\}] - D_i) (\text{cov}^{-1})_{ij} (T_j[\{\mathbf{a}\}] - D_j)$$

$$(\text{cov})_{ij} = \delta_{ij} s_i^2 + \left(\sum_{\alpha}^{N_c} \sigma_{i,\alpha}^{(c)} \sigma_{j,\alpha}^{(c)} + \sum_{\alpha}^{N_{\mathcal{L}}} \sigma_{i,\alpha}^{(\mathcal{L})} \sigma_{j,\alpha}^{(\mathcal{L})} \right) D_i D_j$$

Optimisation should minimise the noise in the χ^2 driven by noisy experimental data

Additional complications in case of a redundant parametrisation (huge parameter space)

- ① need to explore the parameter space as uniformly as possible
(in order to avoid stopping the fit in a local minimum)
→ genetic algorithms
- ② need for a computationally efficient minimisation
(non-trivial relationship between FFs and observables via convolution)
→ adaptive algorithms
- ③ need to define a criterion for minimisation stopping
(avoid learning statistical fluctuations of the data)
→ cross-validation

The Hessian method: general strategy

- ① Expand the χ^2 about its global minimum at first (nontrivial) order

$$\chi^2\{\mathbf{a}\} \approx \chi^2\{\mathbf{a}_0\} + \delta a^i H_{ij} \delta a^j, \quad H_{ij} = \frac{1}{2} \left. \frac{\partial^2 \chi^2\{\mathbf{a}\}}{\partial a_i \partial a_j} \right|_{\{\mathbf{a}\}=\{\mathbf{a}_0\}}$$

- ② Assume linear error propagation for any observable \mathcal{O} depending on $\{\mathbf{a}\}$

$$\langle \mathcal{O}\{\mathbf{a}\} \rangle \approx \mathcal{O}\{\mathbf{a}_0\} + a_i \left. \frac{\partial \mathcal{O}\{\mathbf{a}\}}{\partial a_i} \right|_{\{\mathbf{a}\}=\{\mathbf{a}_0\}} \quad \sigma_{\mathcal{O}\{\mathbf{a}\}} \approx \sigma_{ij} \left. \frac{\partial \mathcal{O}\{\mathbf{a}\}}{\partial a_i} \right. \left. \frac{\partial \mathcal{O}\{\mathbf{a}\}}{\partial a_j} \right|_{\{\mathbf{a}\}=\{\mathbf{a}_0\}}$$

- ③ Determine σ_{ij} from H_{ij} from maximum likelihood (under Gaussian hypothesis)

$$\sigma_{ij}^{-1} = \left. \frac{\partial^2 \chi^2\{\mathbf{a}\}}{\partial a_i \partial a_j} \right|_{\{\mathbf{a}\}=\{\mathbf{a}_0\}} = H_{ij}$$

- ④ A C.L. about the best fit is obtained as the volume (in parameter space) about $\chi^2\{\mathbf{a}_0\}$ that corresponds to a fixed increase of the χ^2 ; for Gaussian uncertainties:

$$68\% \text{ C.L.} \iff \Delta \chi^2 = \chi^2\{\mathbf{a}\} - \chi^2\{\mathbf{a}_0\} = 1$$

The Hessian method: some remarks

- ① Parameters can always be adjusted so that all eigenvalues of H_{ij} are equal to one (diagonalise H_{ij} and rescale the eigenvectors by their eigenvalues)

$$\delta a_i H_{ij} \delta a_j = \sum_{i=1}^{N_{\text{par}}} [a'_i(a_i)]^2 \iff \sigma_{\mathcal{O}\{\mathbf{a}'\}} = |\nabla' \mathcal{O}\{\mathbf{a}'\}|$$

- ② Compact representation and computation of observables and their uncertainties

$$\langle \mathcal{O}[D(x, Q^2)] \rangle = \mathcal{O}[D_0(x, Q^2)]$$

$$\sigma_{\mathcal{O}}[D(x, Q^2)] = \left[\sum_{i=1}^{N_{\text{par}}} (\mathcal{O}[D_i(x, Q^2)] - \mathcal{O}[D_0(x, Q^2)])^2 \right]^{1/2}$$

- ③ Uncertainties obtained with $\Delta\chi^2 = 1$ might be unrealistically small (inadequacy of the linear approximation)
- ④ Rescale to the $\Delta\chi^2 = T$ interval such that correct C.L.s are reproduced (no statistically rigorous interpretation of T (tolerance))
- ⑤ Unmanageable Hessian matrix if the number of parameters is huge

The Monte Carlo method: general strategy

- ① Generate (*art*) replicas of (*exp*) data according to the distribution

$$\mathcal{O}_i^{(art)(k)} = \mathcal{O}_i^{(exp)} + r_i^{(k)} \sigma_{\mathcal{O}_i}, \quad i = 1, \dots, N_{\text{dat}}, \quad k = 1, \dots, N_{\text{rep}}$$

where $r_i^{(k)}$ are (Gaussianly distributed) random numbers for each k -th replica
($r_i^{(k)}$ can be generated with any distribution, not necessarily Gaussian)

- ② Validate the Monte Carlo sample size against experimental data
- ③ Perform a fit for each replica $k = 1, \dots, N_{\text{rep}}$
- ④ Compact computation of observables and their uncertainties
(PDF replicas are equally probable members of a statistical ensemble)

$$\langle \mathcal{O}[D(x, Q^2)] \rangle = \frac{1}{N_{\text{rep}}} \sum_{k=1}^{N_{\text{rep}}} \mathcal{O}[D^{(k)}(x, Q^2)]$$

$$\sigma_{\mathcal{O}}[D(x, Q^2)] = \left[\frac{1}{N_{\text{rep}} - 1} \sum_{k=1}^{N_{\text{rep}}} \left(\mathcal{O}[D^{(k)}(x, Q^2)] - \langle \mathcal{O}[D(x, Q^2)] \rangle \right)^2 \right]^{1/2}$$

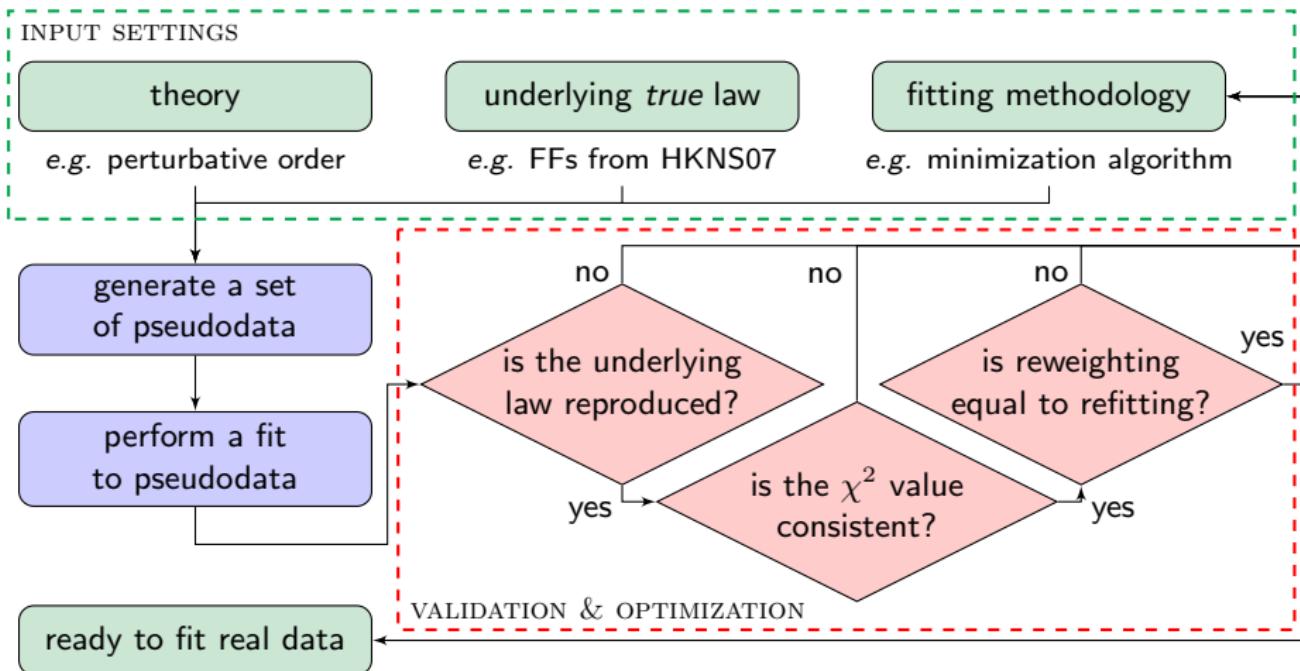

⇒ no need to rely on linear approximation

⇒ computational expensive: need to perform N_{rep} fits instead of one

Methodology validation: closure tests

[JHEP 1504 (2015) 040]

Validation and optimization of the fitting strategy with known underlying physical law

Full control of procedural uncertainties

Closure tests: levels

- ➊ Level 0: generate pseudodata D_i^0 with zero uncertainty
(but $(\text{cov})_{ij}$ in the χ^2 is the data covariance matrix)
→ fit quality can be arbitrarily good, if the fitting methodology is efficient: $\chi^2/N_{\text{dat}} \sim 0$
→ validate fitting methodology (parametrisation, minimisation)
→ interpolation and extrapolation uncertainty
- ➋ Level 1: generate pseudodata D_i^1 with stochastic fluctuations (no replicas)

$$D_i^1 = (1 + r_i^{\text{nor}} \sigma_i^{\text{nor}}) \left(D_i^0 + \sum_p^{N_{\text{sys}}} r_{i,p}^{\text{sys}} \sigma_{i,p}^{\text{sys}} + r_i^{\text{stat}} \sigma_i^{\text{stat}} \right)$$

- experimental uncertainties are not propagated into FFs: $\chi^2/N_{\text{dat}} \sim 1$
→ functional uncertainty (a large number of functional forms with equally good χ^2)

- ➌ Level 2: generate N_{rep} Monte Carlo pseudodata replicas $D_i^{2,k}$ on top of Level 1

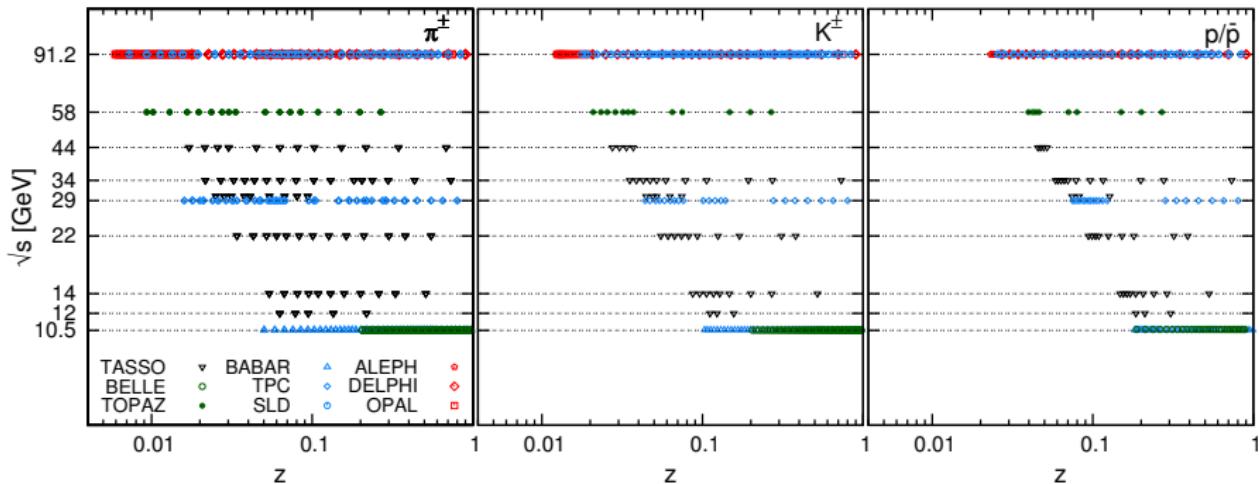

$$D_i^{2,k} = (1 + r_i^{\text{nor},k} \sigma_i^{\text{nor}}) \left(D_i^1 + \sum_p^{N_{\text{sys}}} r_{i,p}^{\text{sys},k} \sigma_{i,p}^{\text{sys}} + r_i^{\text{stat},k} \sigma_i^{\text{stat}} \right)$$

- propagate the fluctuations due to experimental uncertainties into FFs: $\chi^2/N_{\text{dat}} \sim 1$
→ input FFs lie within the one-sigma band of the fitted FFs with a probability of $\sim 68\%$
→ data uncertainty

3. The NNFF1.0 analysis

[EPJ C77 (2017) 516]

The dataset

CERN-LEP: ALEPH [ZP C66 (1995) 353] DELPHI [EPJ C18 (2000) 203] OPAL [ZP C63 (1994) 181]

KEK: BELLE ($n_f = 4$) [PRL 111 (2013) 062002] TOPAZ [PL B345 (1995) 335]

DESY-PETRA: TASSO [PL B94 (1980) 444, ZP C17 (1983) 5, ZP C42 (1989) 189]

SLAC: BABAR ($n_f = 4$) [PR D88 (2013) 032011] SLD [PR D58 (1999) 052001] TPC [PRL 61 (1988) 1263]

$$\frac{d\sigma^h}{dz} = \frac{4\pi\alpha^2(Q^2)}{Q^2} \mathcal{F}_2^h(z, Q^2) \quad h = \pi^+ + \pi^-, K^+ + K^-, p + \bar{p} \quad \text{possibly normalised to } \sigma_{\text{tot}}$$

$$N_{\text{dat}}^{\pi^{\pm}} = 428$$

$$N_{\text{dat}}^{K^{\pm}} = 385$$

$$N_{\text{dat}}^{p/\bar{p}} = 360$$

From observables to fragmentation functions

$$\mathcal{F}_2^h = \langle e^2 \rangle \left\{ C_{2,q}^S \otimes D_\Sigma^h + n_f C_{2,g}^S \otimes D_g^h + C_{2,q}^{NS} \otimes D_{NS}^h \right\}$$

$$\langle e^2 \rangle = \frac{1}{n_f} \sum_{q=1}^{n_f} \hat{e}_q^2 \quad D_\Sigma^h = \sum_{q=1}^{n_f} D_{q+}^h \quad D_{NS}^h = \sum_{q=1}^{n_f} \left(\frac{\hat{e}_q^2}{\langle e^2 \rangle} - 1 \right) D_{q+}^h \quad D_{q+}^h = D_q^h + D_{\bar{q}}^h$$

Coefficient functions and splitting functions known up to NNLO

[NPB 751 (2006) 18; NPB 749 (2006) 1; PLB 638 (2006) 61; NPB 845 (2012) 133]

$$\begin{aligned} F_2^{h,n_f=5} = & \frac{1}{5} \left[(2\hat{e}_u^2 + 3\hat{e}_d^2) C_{2,q}^S + 3(\hat{e}_u^2 - \hat{e}_d^2) C_{2,q}^{NS} \right] \otimes \left(D_{u+}^h + D_{c+}^h \right) \\ & + \frac{1}{5} \left[(2\hat{e}_u^2 + 3\hat{e}_d^2) C_{2,q}^S - 2(\hat{e}_u^2 - \hat{e}_d^2) C_{2,q}^{NS} \right] \otimes \left(D_{d+}^h + D_{s+}^h + D_{b+}^h \right) \\ & + (2\hat{e}_u^2 + 3\hat{e}_d^2) C_{2,g}^S \otimes D_g^h \end{aligned}$$

No sensitivity to individual quark and antiquark FFs

Limited sensitivity to flavour separation via the variation of \hat{e}_q with Q^2
 $\hat{e}_u^2/\hat{e}_d^2(Q^2 = 10 \text{ GeV}) \sim 4 \Rightarrow D_{u+}^h, D_{d+}^h + D_{s+}^h$; $\hat{e}_u^2/\hat{e}_d^2(Q^2 = M_Z) \sim 0.8 \Rightarrow D_\Sigma^h$
Flavor separation between uds and c, b quarks achieved thanks to tagged data

Direct sensitivity to D_g^h only beyond LO, as $C_{2,g}^S$ is $\mathcal{O}(\alpha_s^2)$, and tenous
Indirect sensitivity to D_g^h via scale violations in the time-like DGLAP evolution

Fit settings

Physical parameters: consistent with the NNPDF3.1 PDF set [EPJC77 (2017) 663]

$$\alpha_s(M_Z) = 0.118, \alpha(M_Z) = 1/127, m_c = 1.51 \text{ GeV}, m_b = 4.92 \text{ GeV}$$

Solution of DGLAP equations: numerical solution in z -space as implemented in APFEL
extensive benchmark performed up to NNLO [JHEP 1503 (2015) 046]

Parametrisation: each FF is parametrised with a feed-forward neural network (2-5-3-1)

$$D_i^h(Q_0, z) = \text{NN}(x) - \text{NN}(1), \quad Q_0 = 5 \text{ GeV}$$

$$h = \pi^+ + \pi^-, h = K^+ + K^-, h = p + \bar{p} \quad i = u^+, d^+ + s^+, c^+, b^+, g$$

we assume charge conjugation, from which $D_{q^+}^{\pi^+} = D_{q^+}^{\pi^-}$

initial scale above m_b , but below the lowest c.m. energy of the data, avoid threshold crossing

Heavy flavours: heavy-quark FFs are parametrised independently at the initial scale Q_0

Hadron mass corrections: included exactly à la Albino-Kniehl-Kramer [NPB 803 (2008) 42]

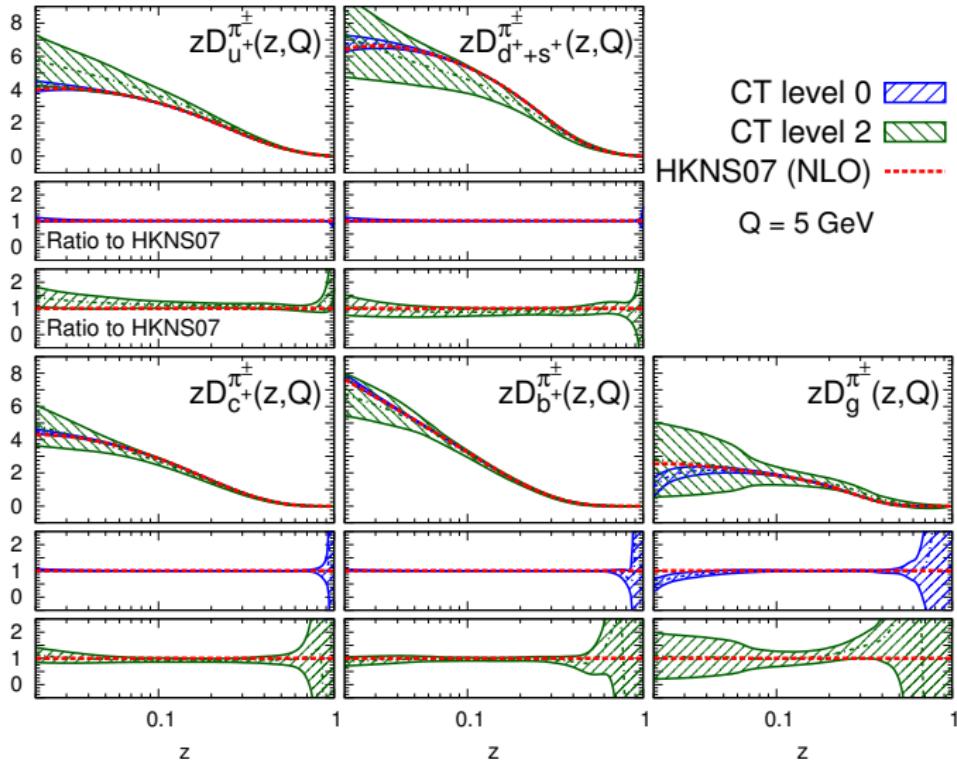

Kinematic cuts: $z \rightarrow 0$: contributions $\propto \ln z$; $z \rightarrow 1$: contributions $\propto \ln(1-z)$

$$z_{\min} = 0.075, z_{\max} = 0.02 (\sqrt{s} = M_Z); z_{\max} = 0.90$$

Momentum sum rule: check a posteriori that

$$\sum_{h=\pi^\pm, K^\pm, p/\bar{p}} \int_{z_{\min}}^1 dz z D_i^h(z, Q) < N \quad N \begin{cases} = 1 & \text{for } i = g \\ = 2 & \text{for } i = u^+, c^+, b^+ \\ = 4 & \text{for } i = d^+ + s^+ \end{cases}$$

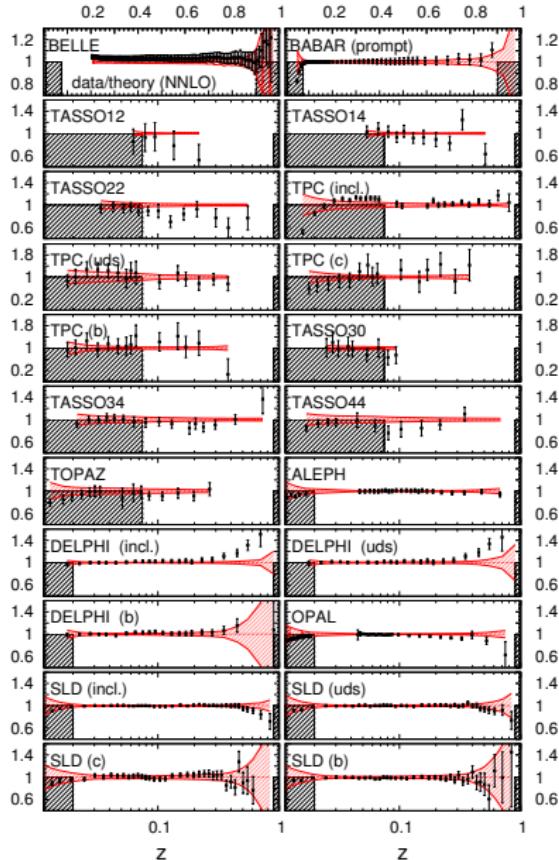

Closure testing NNFF1.0

$$\chi^2/N_{\text{dat}} = 0.0001 \text{ (L0)}$$

$$\chi^2/N_{\text{dat}} = 1.0262 \text{ (L1)}$$

Excellent perturbative convergence
 FFs almost stable from NLO to NNLO
 LO FF uncertainties larger than HO

i	$N^{i+1}\text{LO}/N^i\text{LO}$	D_g	D_Σ	D_{c+}	D_{b+}
0	NLO/LO [%]	95-300	70-80	65-80	70-85
1	NNLO/NLO [%]	70-130	90-100	90-110	95-115

Comparison with other FF determinations: K^+

DEHSS [PRD 95 (2017) 094019]
 (+SIDIS +PP)

JAM [PRD 94 (2016) 114004]
 (almost same dataset as NNFF1.0)

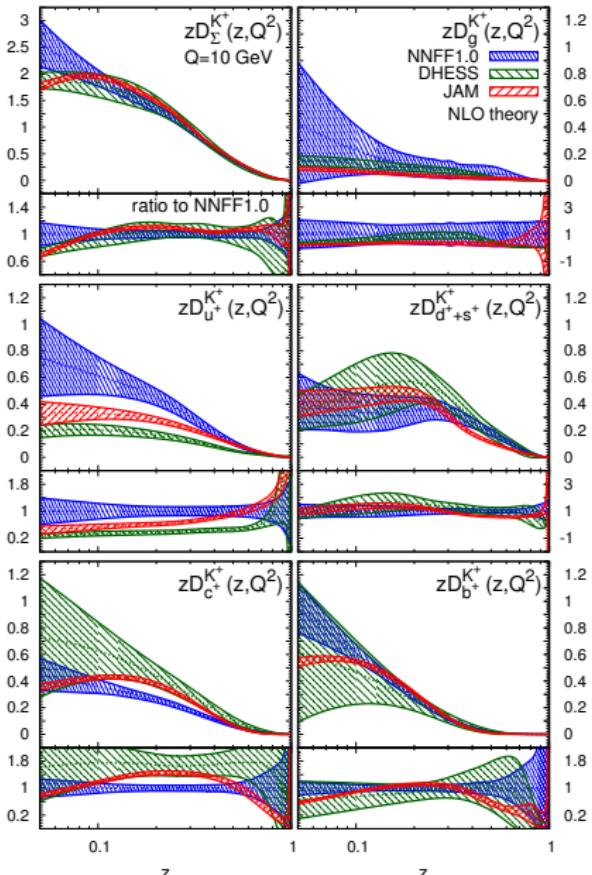

$D_{\Sigma}^{\pi^+}$: excellent agreement (both c.v. and unc.)
 bulk of the dataset

$D_g^{\pi^+}$: good mutual agreement
 similar shapes, larger uncertainties
 DEHSS: data; JAM: parametrisation

$D_{u^+}^{\pi^+}$: mutual sizable disagreement
 differences in dataset and parametrisation
 comparable uncertainties in the data region

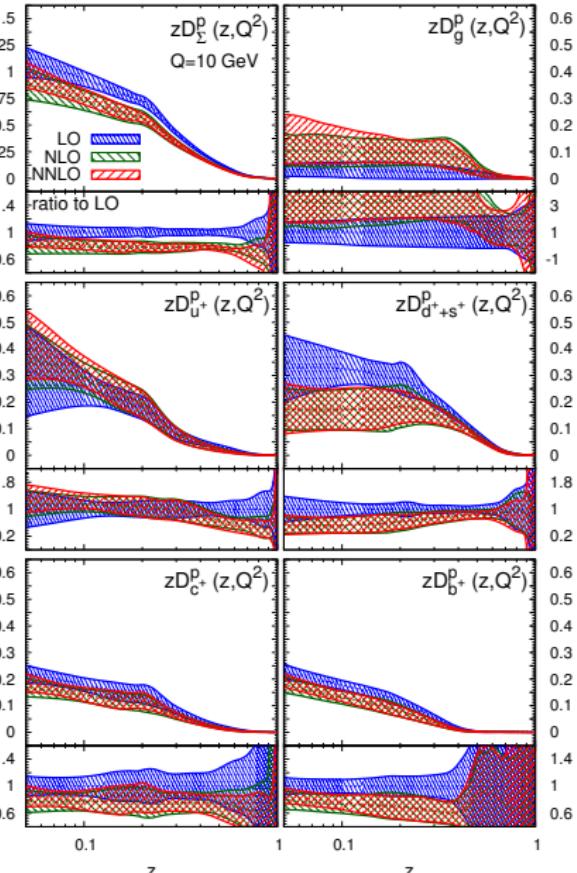

$D_{d^+}^{\pi^+} + D_{s^+}^{\pi^+}$: fair mutual agreement
 differences in dataset and parametrisation
 comparable uncertainties in the data region

$D_{c^+}^{\pi^+}, D_{b^+}^{\pi^+}$: excellent mutual agreement
 uncertainties similar to JAM
 DHESS shows inflated uncertainties

Dependence upon perturbative order: p/\bar{p}

LO FF uncertainties larger than HO
Dependence upon data set and kin cuts
similar to pions and kaons

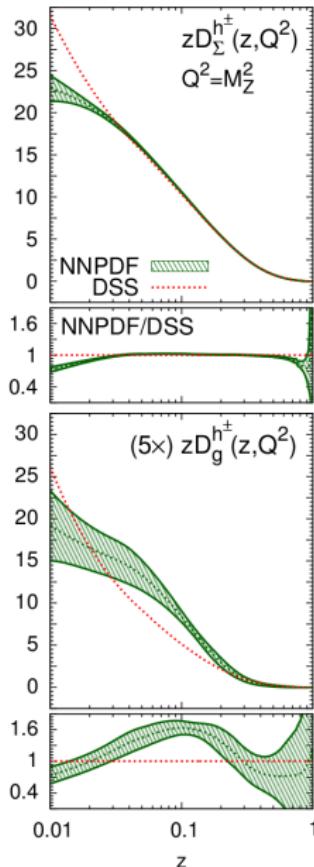

Fragmentation functions of unidentified charged hadrons

Combine the information from identified π^\pm , K^\pm and p/\bar{p} FFs
with that from residual light charged hadrons [arXiv:1709.03400]

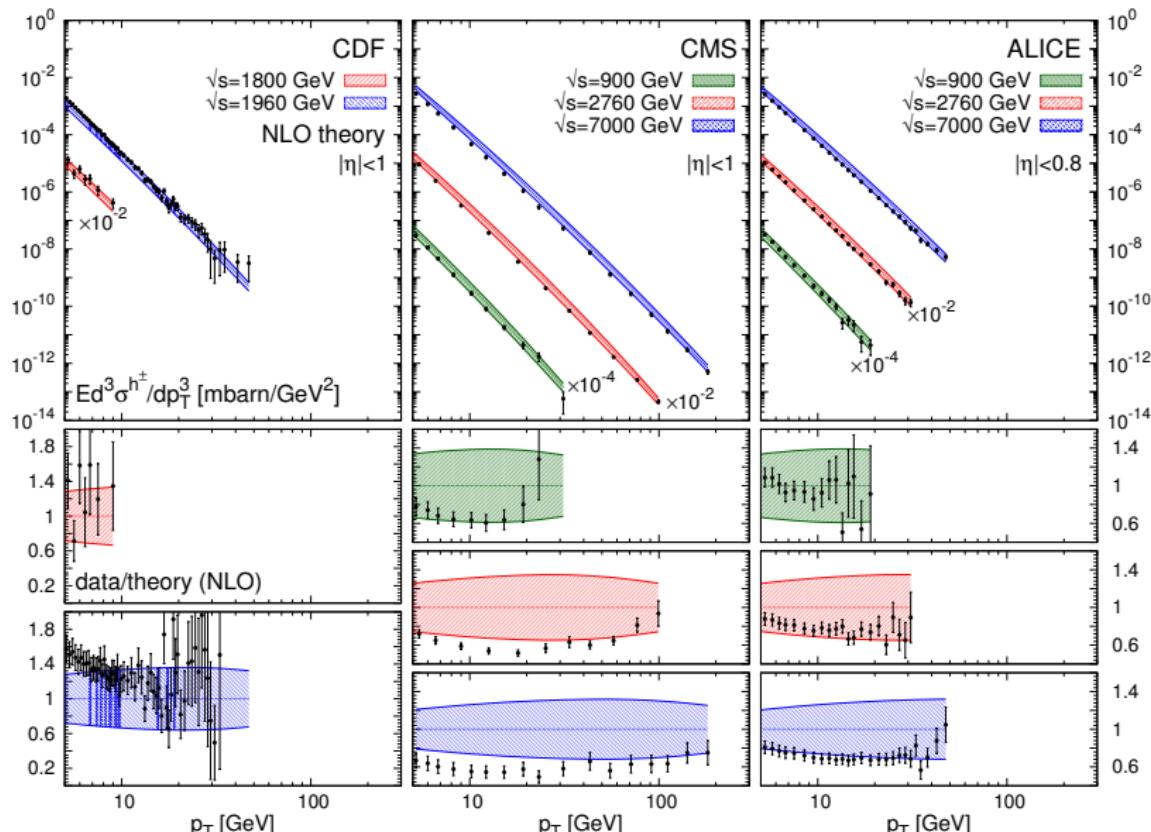

Preliminary analysis done consistently with NNFF1.0 (NLO)

Additional F_L data (non-vanishing $\mathcal{O}(\alpha_s)$ contribution at LO)

Fragmentation functions of unidentified charged hadrons

4. Summary and outlook

Conclusions

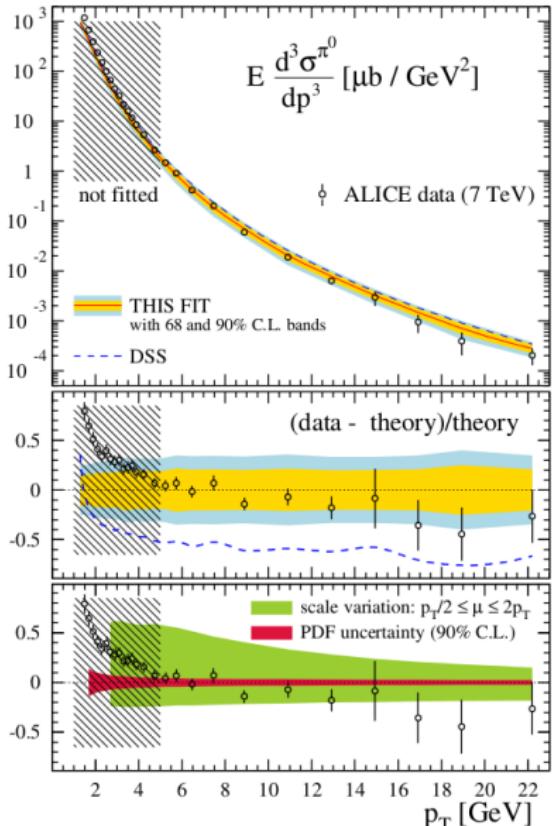

- ① A number of hard-scattering processes require an appropriate knowledge of FFs
 - ▶ probing nucleon momentum, spin and flavour
 - ▶ underlying spatial distributions and the dynamics of nuclear matter
- ② FFs are poorly known in comparison to PDFs
 - ▶ limited set of available data, observables often require PDFs and FFs simultaneously
 - ▶ troubles in describing some observables from pp and SIDIS from current FF sets
- ③ New analysis based on the NNPDF methodology, NNFF1.0
 - ▶ at LO, NLO and NNLO, based on SIA data for π^\pm , K^\pm and p/\bar{p}
 - ▶ completely closure-tested, addresses methodological issues in previous analyses
 - ▶ detailed study of the stability of the results upon variations of the data set/kin cuts
 - ▶ FF uncertainties (gluon) seem to be underestimated in previous determinations
 - ▶ differences in shapes, to be further investigated
 - ▶ good description of the hadron spectra at the LHC within uncertainties
 - ▶ applicability limited by insensitivity to favoured/unfavoured FFs
- ④ Future improvements
 - ▶ More global fits
 - ▶ Simultaneous fits of FFs and PDFs

More global fits
