

nNNPDF1.0 : Nuclear Parton Distributions from Lepton-Nucleus Scattering and the Impact of an Electron-Ion Collider

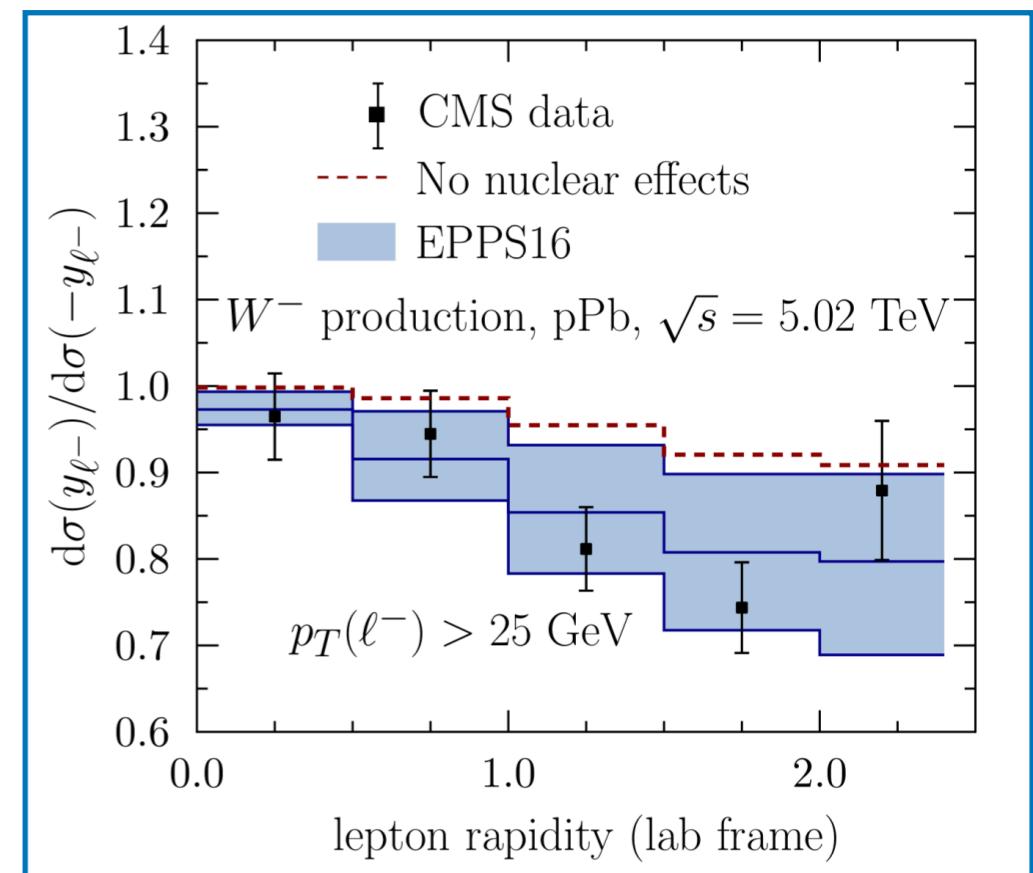

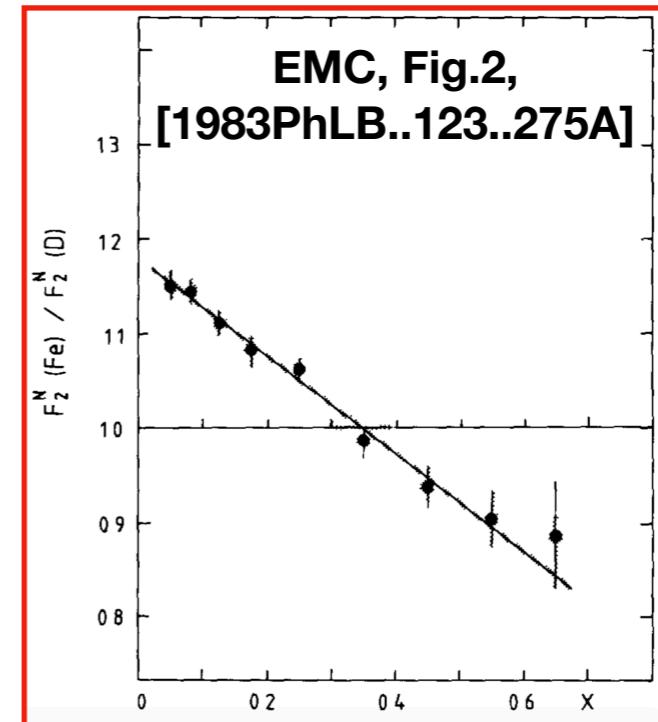

[arXiv:1904.00018](https://arxiv.org/abs/1904.00018)

Rabah Abdul Khalek (speaker), Jake Ethier, Juan Rojo
Departement of Physics and Astronomy, Vrije Universiteit Amsterdam
Nikhef Theory Group

General Motivations

- Understanding QCD in the nuclear environment, e.g **EMC effect**.
- Combining data across different nuclear targets allows testing **different nuclear models**.
- Neutrino-induced CC-DIS on heavy nuclear targets helps **disentangling the proton's q and \bar{q} distributions**.
[See R. Pearson's talk @ 14:20]
- **Lead, Xenon PDF** for the **LHC heavy-ion program**.

Parametrisation

Isoscalar nuclei F_2 as observable

$$xg(x, Q_0, A) = B_g(A)x^{-\alpha_g}(1 - x)^{\beta_g} \xi_3^{(3)}(x, A),$$

$$x\Sigma(x, Q_0, A) = x^{-\alpha_\Sigma}(1 - x)^{\beta_\Sigma} \xi_1^{(3)}(x, A),$$

$$xT_8(x, Q_0, A) = x^{-\alpha_{T_8}}(1 - x)^{\beta_{T_8}} \xi_2^{(3)}(x, A)$$

Momentum Sum Rule

$$B_g(A) = \frac{1 - \int_0^1 dx x\Sigma(x, Q_0, A)}{\int_0^1 dx xg(x, Q_0, A)}.$$

**Anti-correlated
[backup]**

Evolution basis

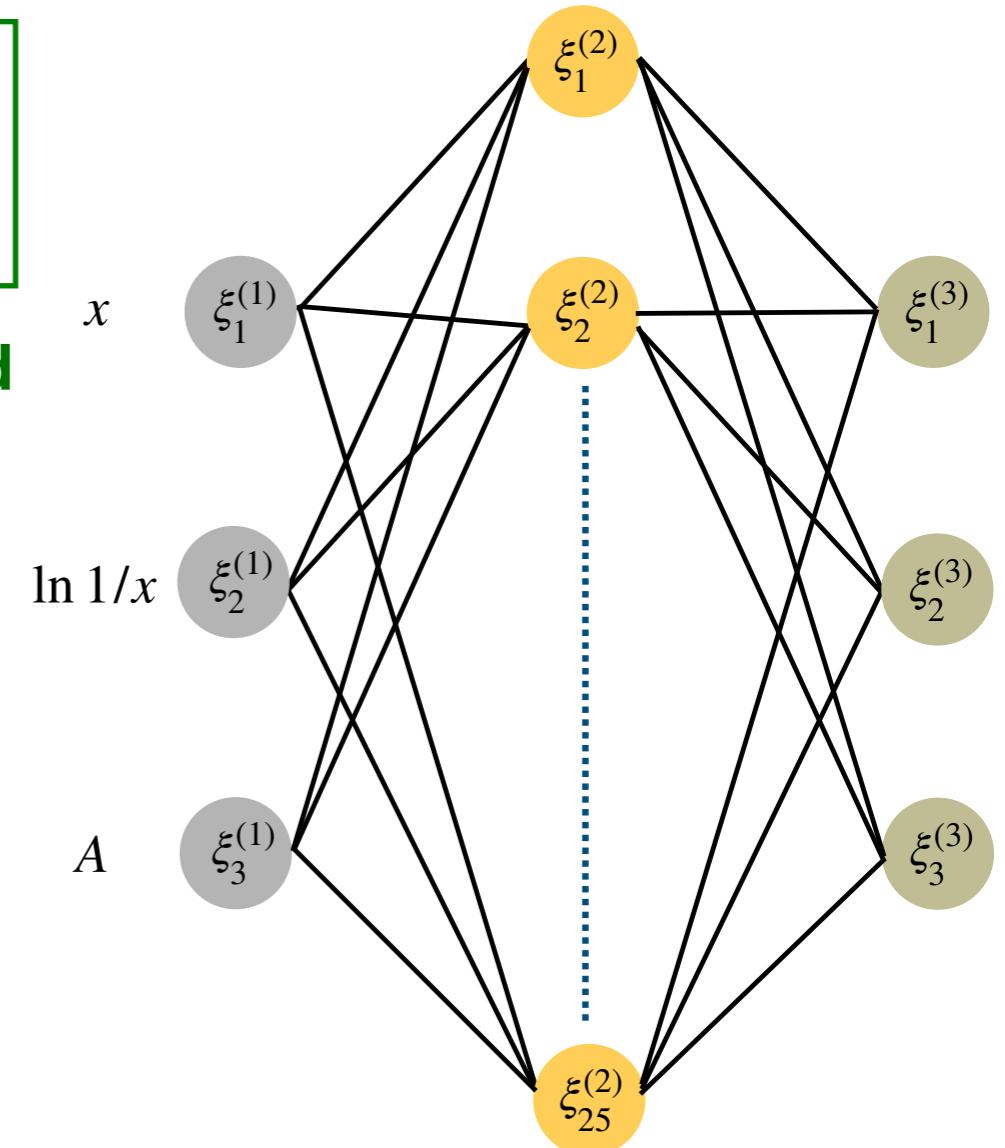

$$\Sigma = \sum_{i=1}^{n_f} q_i^+$$

where: $q^\pm = q \pm \bar{q}$

$$T_3 = u^+ - d^+$$

$$T_8 = u^+ + d^+ - 2s^+$$

**No contribution from T_3
in isoscalar observables**

Cost Function

$$\chi^2 \equiv \sum_{i,j=1}^{N_{\text{dat}}} \left(R_i^{(\text{exp})} - R_i^{(\text{th})}(\{f_m\}) \right) \left(\text{cov}_{t_0} \right)^{-1}_{ij} \left(R_j^{(\text{exp})} - R_j^{(\text{th})}(\{f_m\}) \right) + \lambda \sum_{m=g,\Sigma,T_8} \sum_{l=1}^{N_x} \left(f_m(x_l, Q_0, A) - f_m^{(p+n)/2}(x_l, Q_0) \right)^2.$$

Cost Function

$$\chi^2 \equiv \sum_{i,j=1}^{N_{\text{dat}}} \left(R_i^{(\text{exp})} - R_i^{(\text{th})}(\{f_m\}) \right) \left(\text{cov}_{t_0} \right)^{-1}_{ij} \left(R_j^{(\text{exp})} - R_j^{(\text{th})}(\{f_m\}) \right)$$

$$+ \lambda \sum_{m=g,\Sigma,T_8} \sum_{l=1}^{N_x} \left(f_m(x_l, Q_0, A) - f_m^{(p+n)/2}(x_l, Q_0) \right)^2.$$

Per replica boundary condition on the level of minimisation
to reproduce NNPDF3.1 central value and uncertainties at
A=1 with $x \in [10^{-3}, 0.7]$

Cost Function

Thanks H. Paukkunen for providing
Kinematics + uncertainties.

EIC impact on nPDFs

**Signification reduction of nPDF uncertainties at low- x for large A
Particularly for the higher energy scenario**

Summary

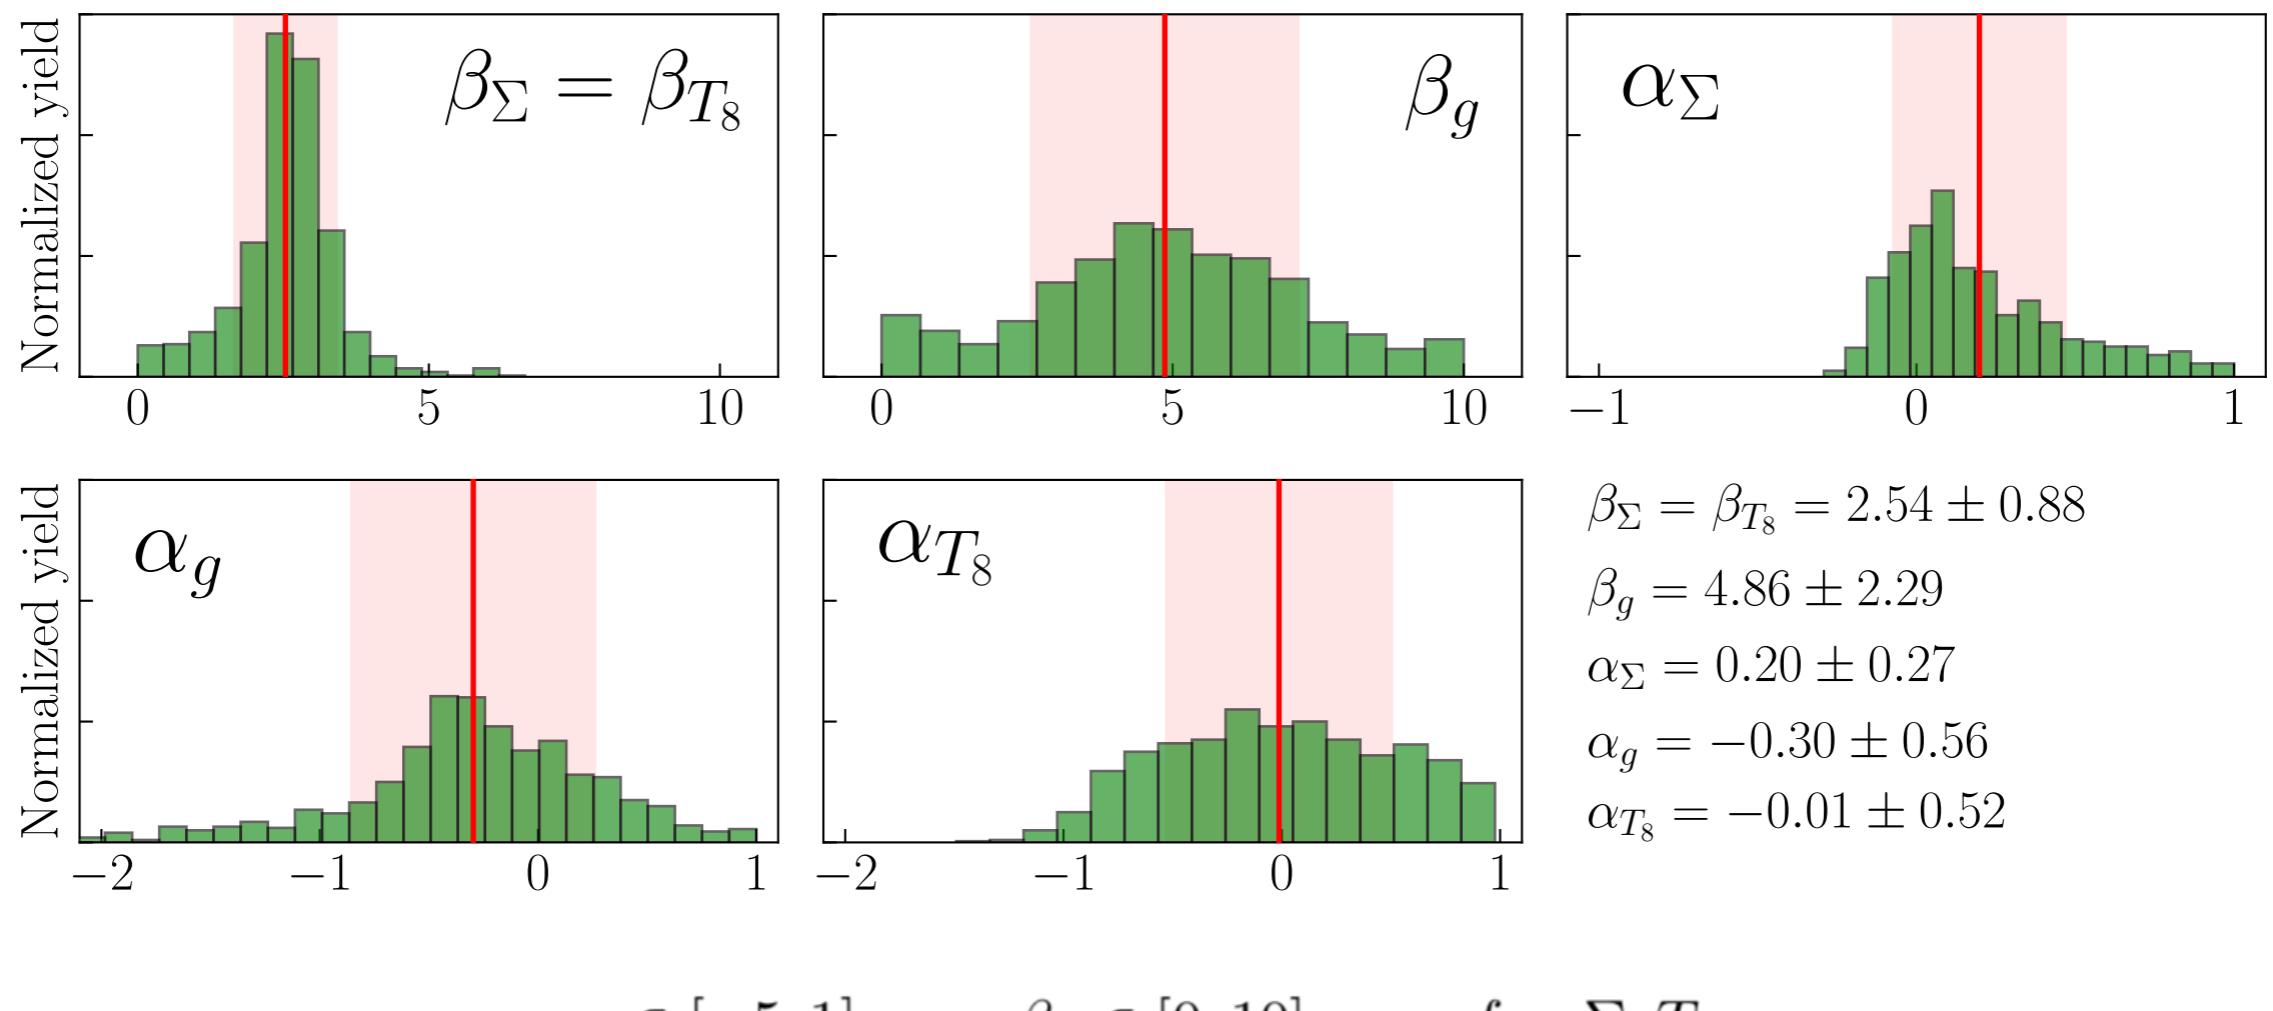

- **First determination of nPDF using NNPDF methodology.**
- **Excellent agreement (NLO and NNLO) with all available NC DIS data (A=2 to A=208).**
- **Quark distributions are reasonably constrained for $x \geq 10^{-2}$.**
- **Significant methodology improvement lead by use of TensorFlow and stochastic gradient descent for the first time in NNPDF.**
- **Vitality of the boundary condition (A=1 limit), reproducing NNPDF3.1 central values and uncertainties of using consistently the same theory settings.**
- **Quantification of the future impact of e+A measurements from an Electron-Ion Collider constraining the quark and gluon nPDFs down to $x \approx 5 \times 10^{-4}$.**
- **LHAPDF sets available on [NNPDF](#) website.**
- **Future steps: including CC DIS data, LHC data in a global fit.**

Backup Slides

Effective Exponents

In previous NNPDF analyses, the preprocessing exponents α_f and β_f were fixed to a randomly chosen value from a range that was determined iteratively.

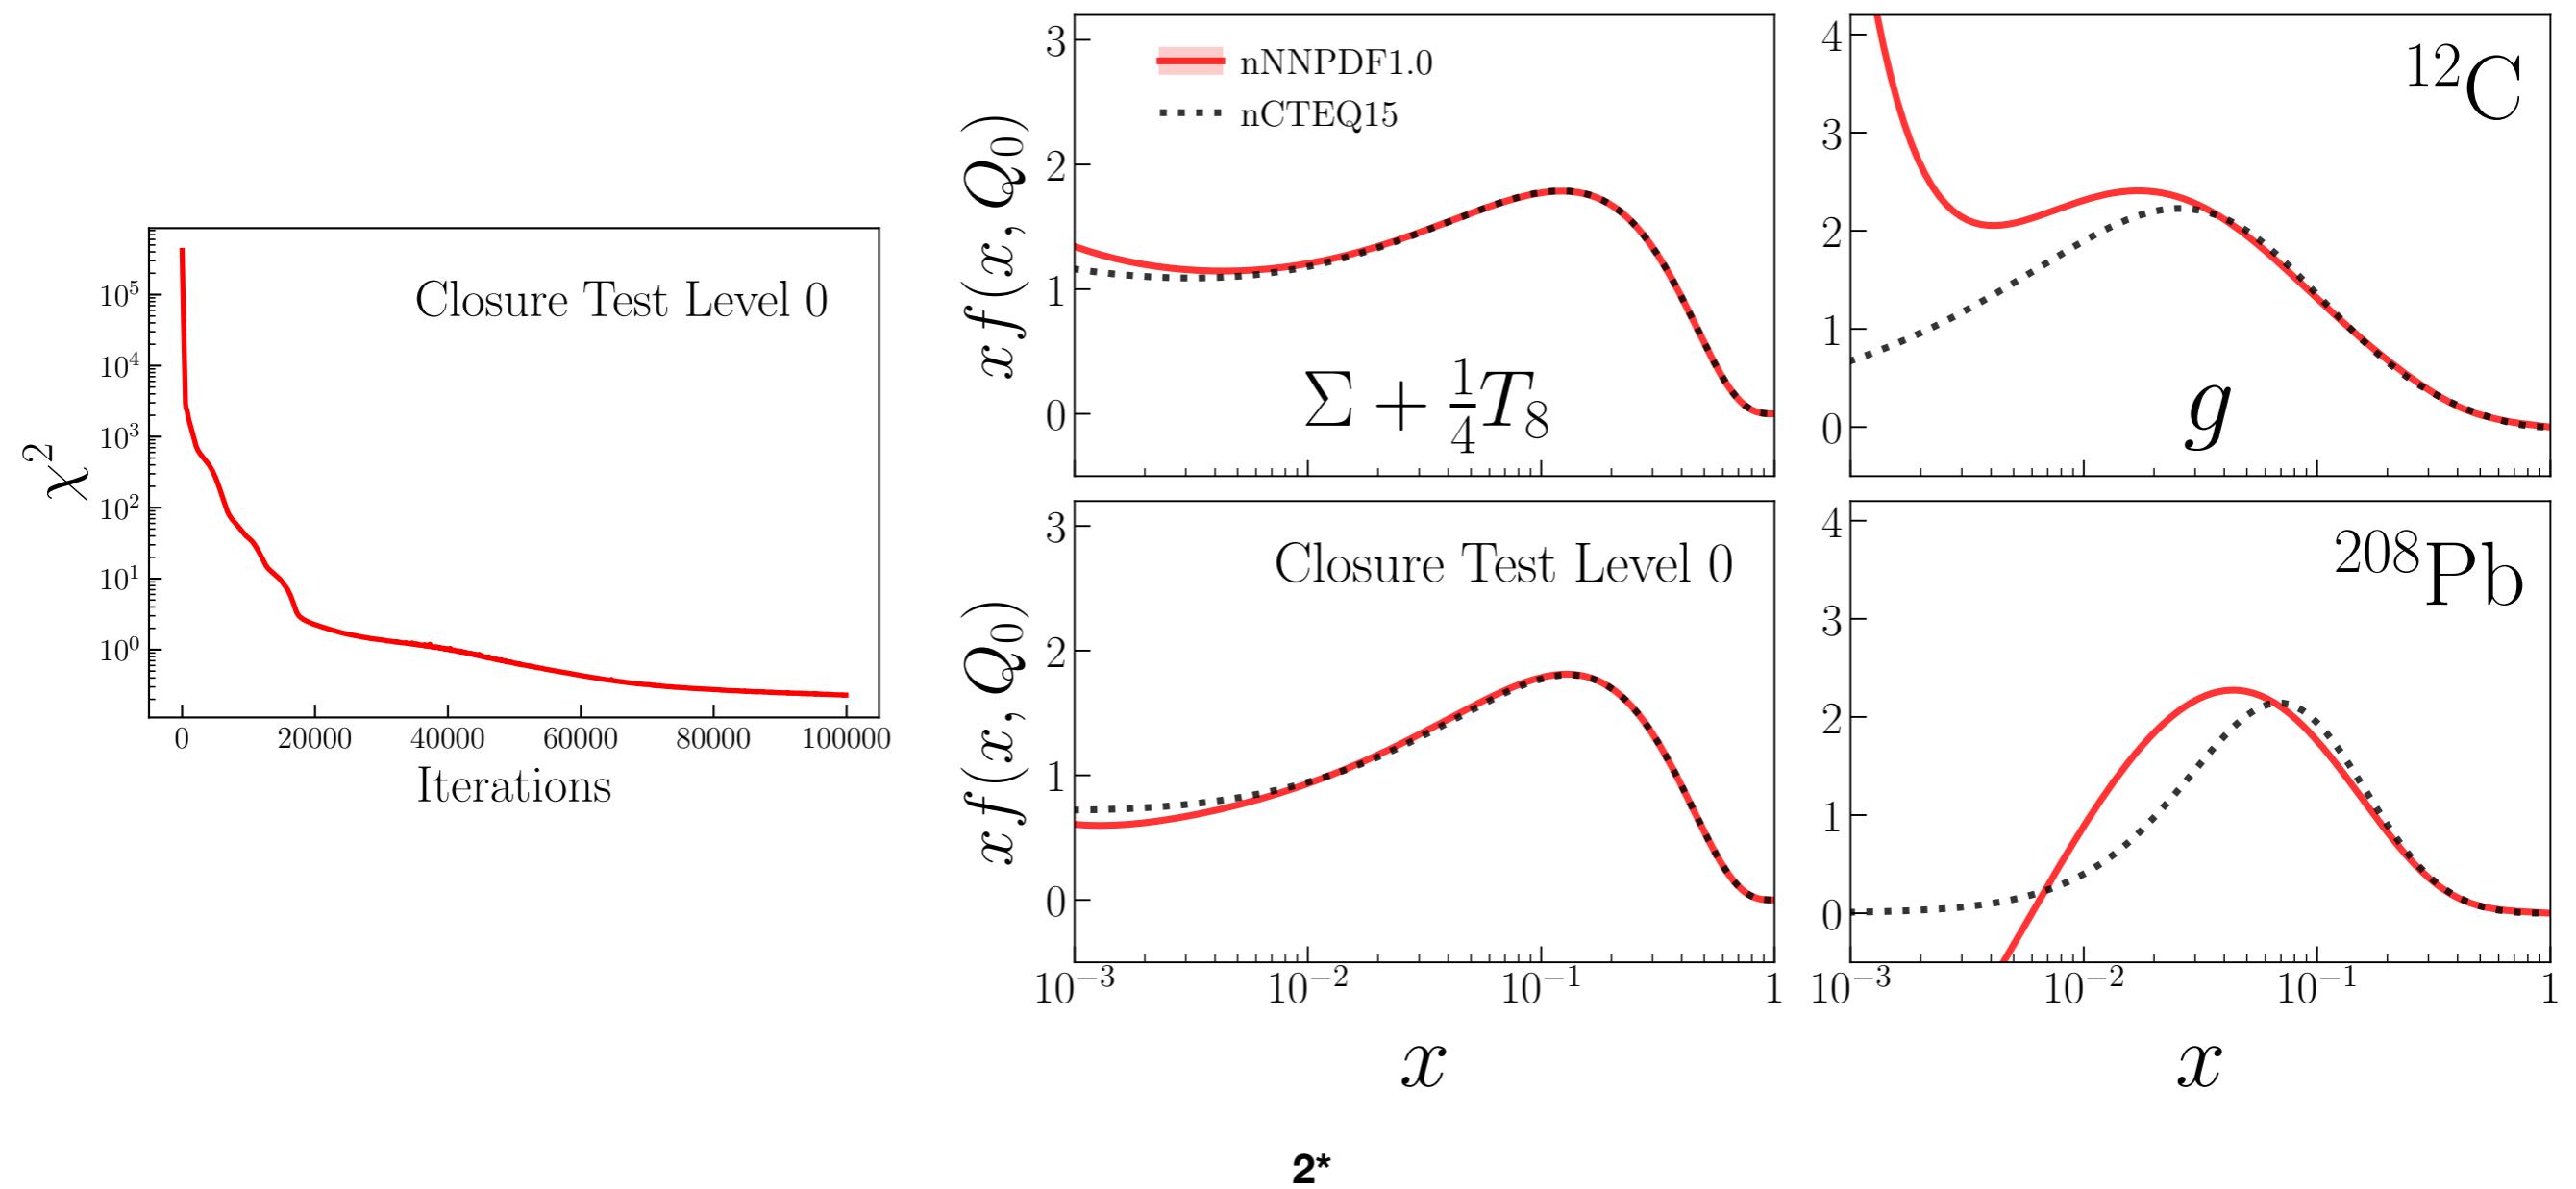

Here instead we will fit their values for each Monte Carlo replica, so that they are treated simultaneously with the weights and thresholds of the neural network.

Closure Test Level 0

Fitting pseudo-data is generated from the nCTEQ distributions without any additional statistical fluctuations.

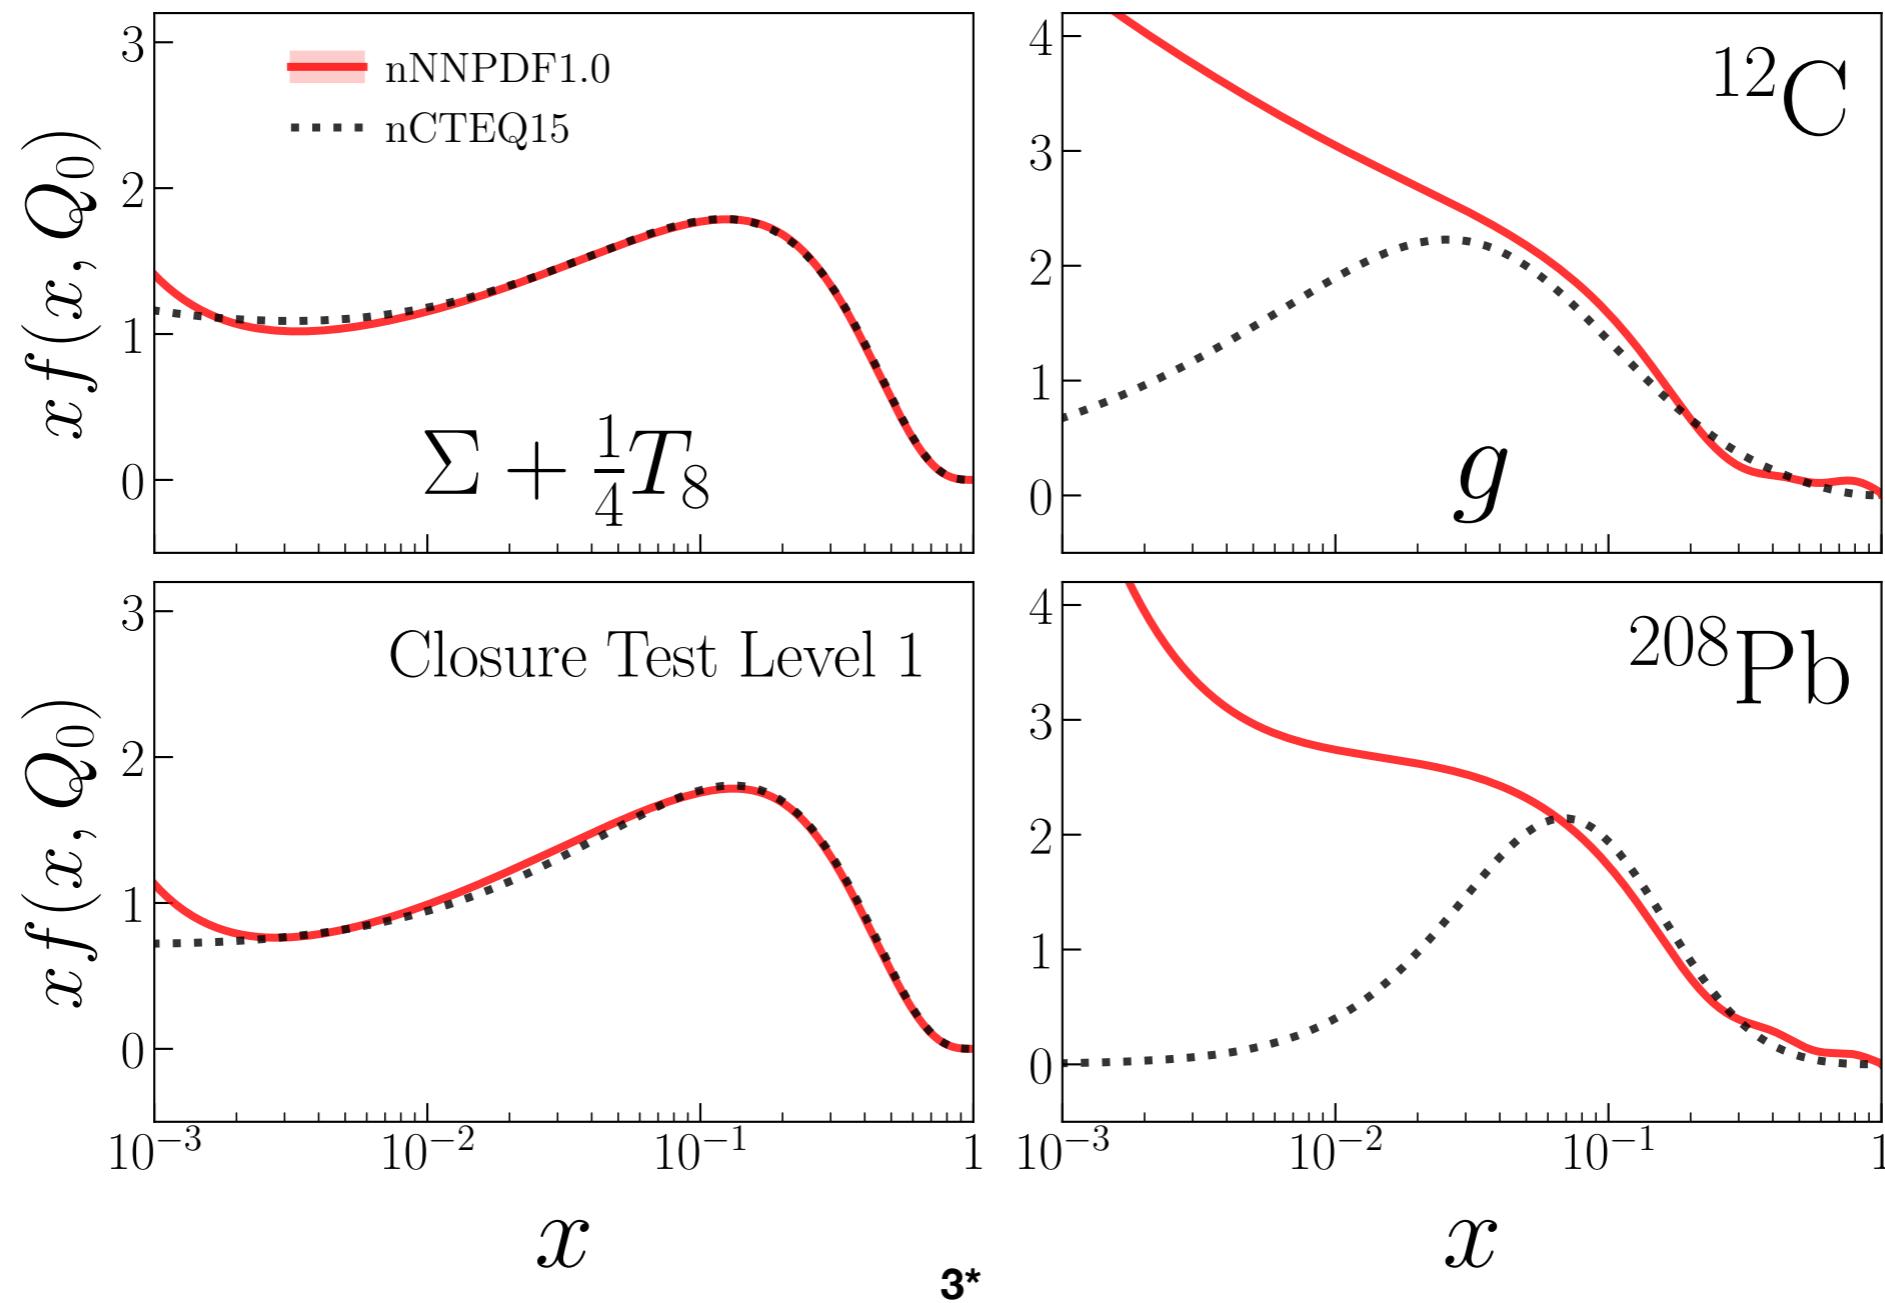

The uncertainties are taken to be the same as the experimental data.

Closure Test Level 1

Pseudo-data is generated by adding statistical fluctuations to nCTEQ15 predictions.

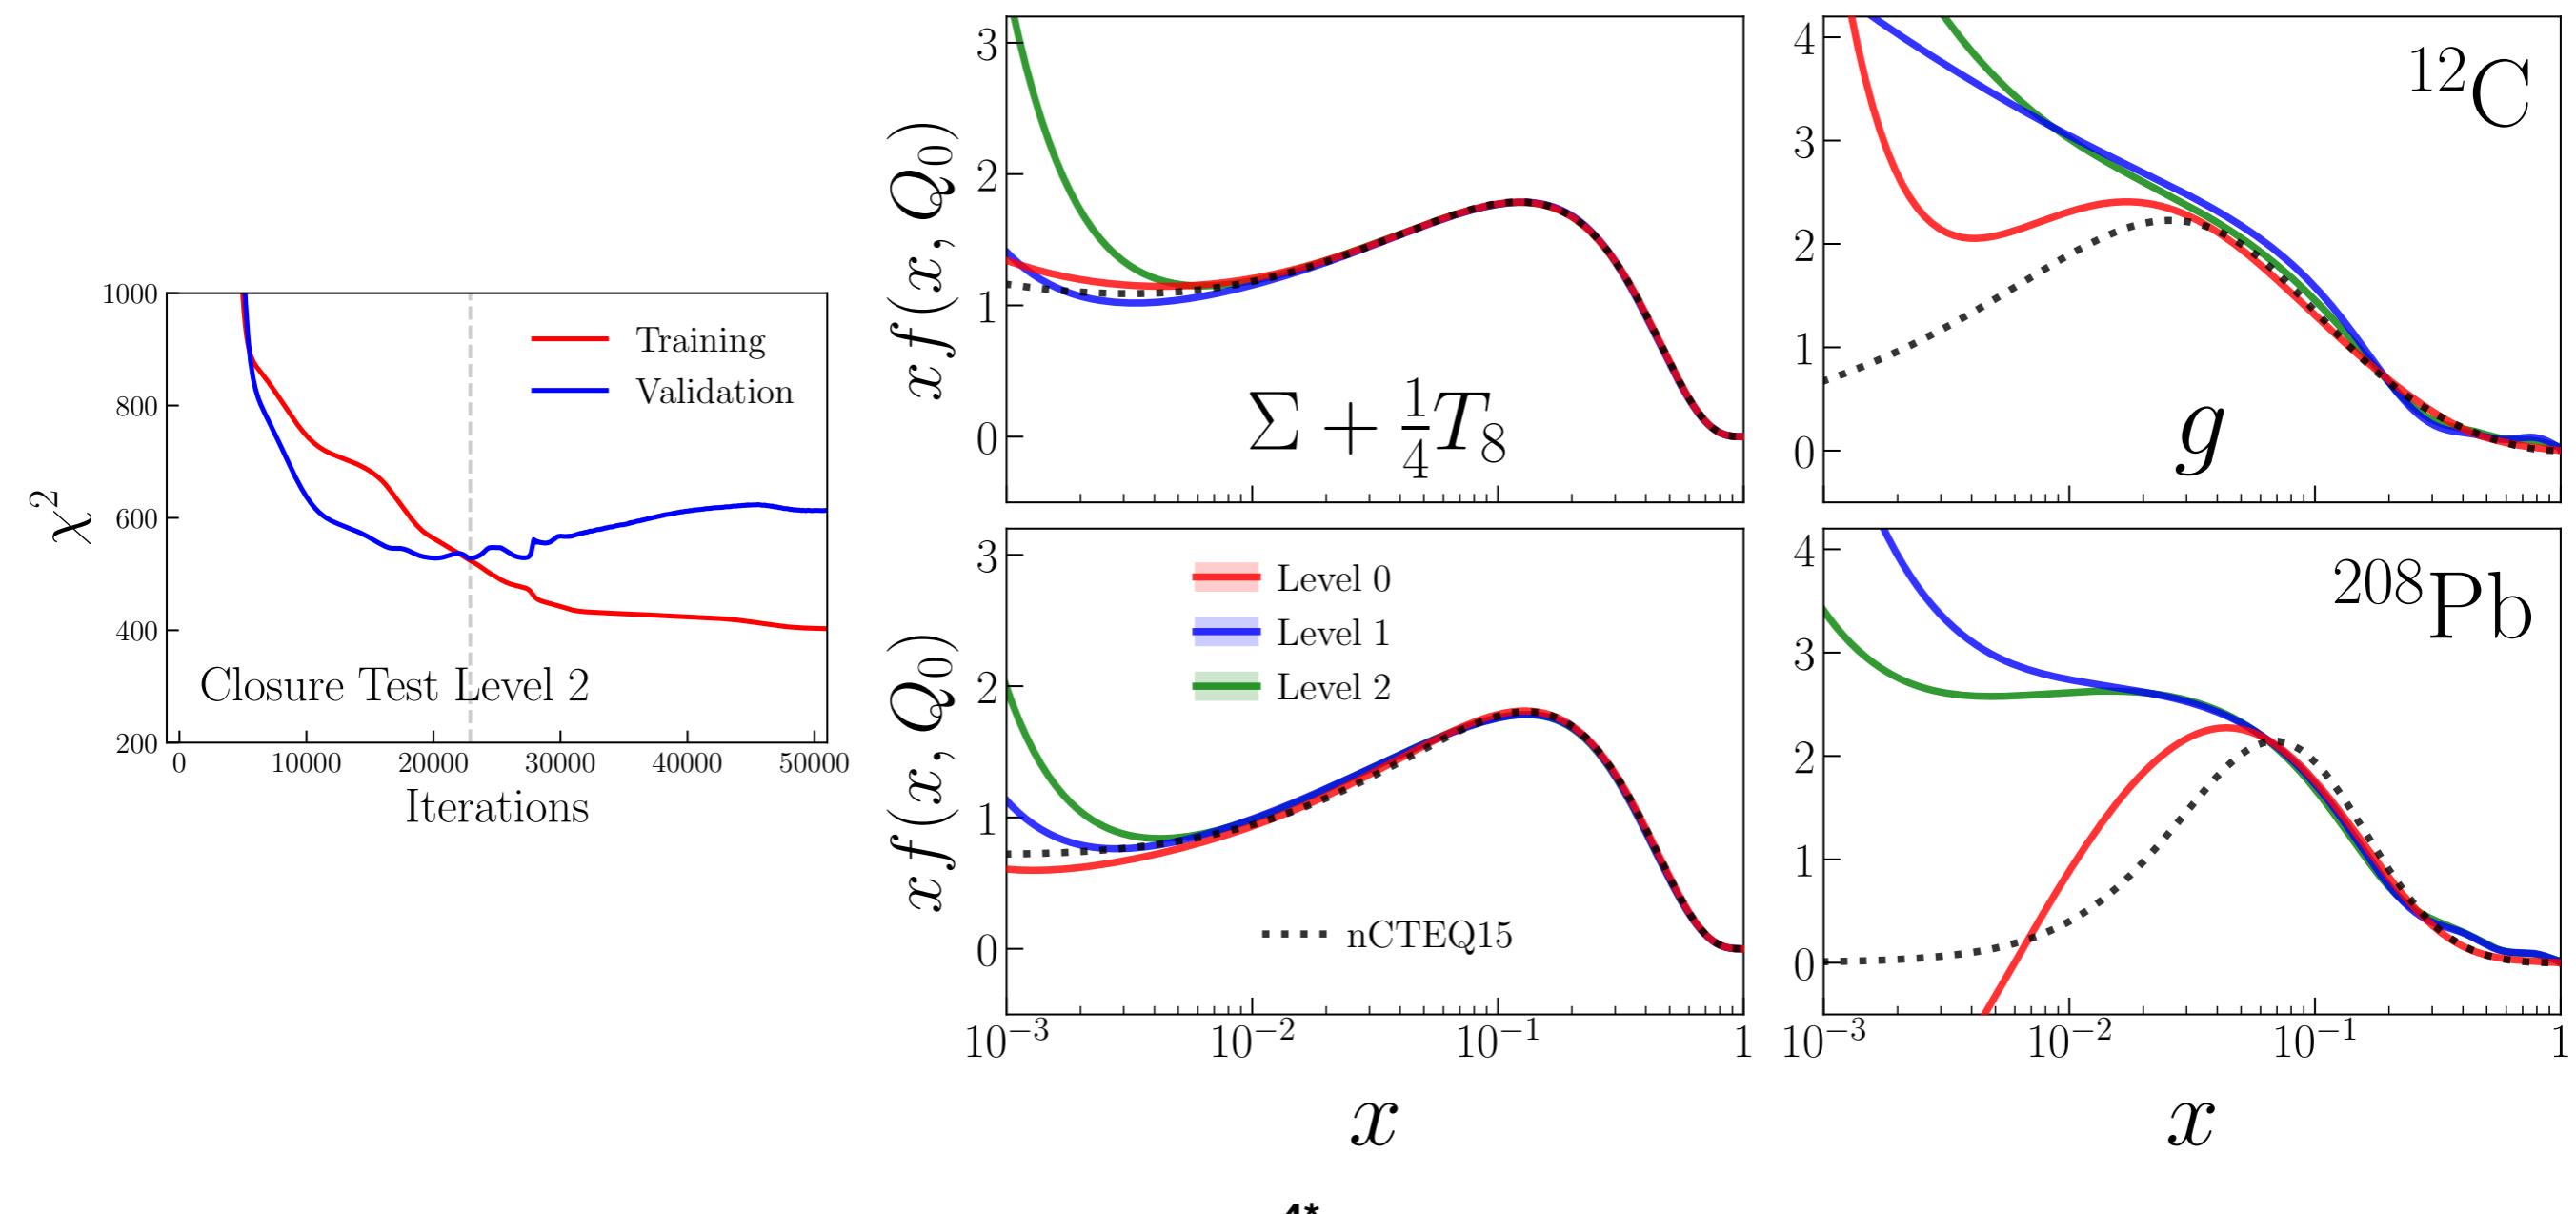

These fluctuations are dictated by the corresponding experimental statistical and systematic uncertainties, and are the same that enter in the t_0 covariance matrix.

Closure Test Level 2

Pseudo-data generated in the L1 case is now used to produce a large Nrep number of Monte Carlo replicas.

A nuclear PDF fit is then performed for each replica, and look-back cross-validation is again activated to prevent over-fitting.

Nuclear NC Inclusive DIS

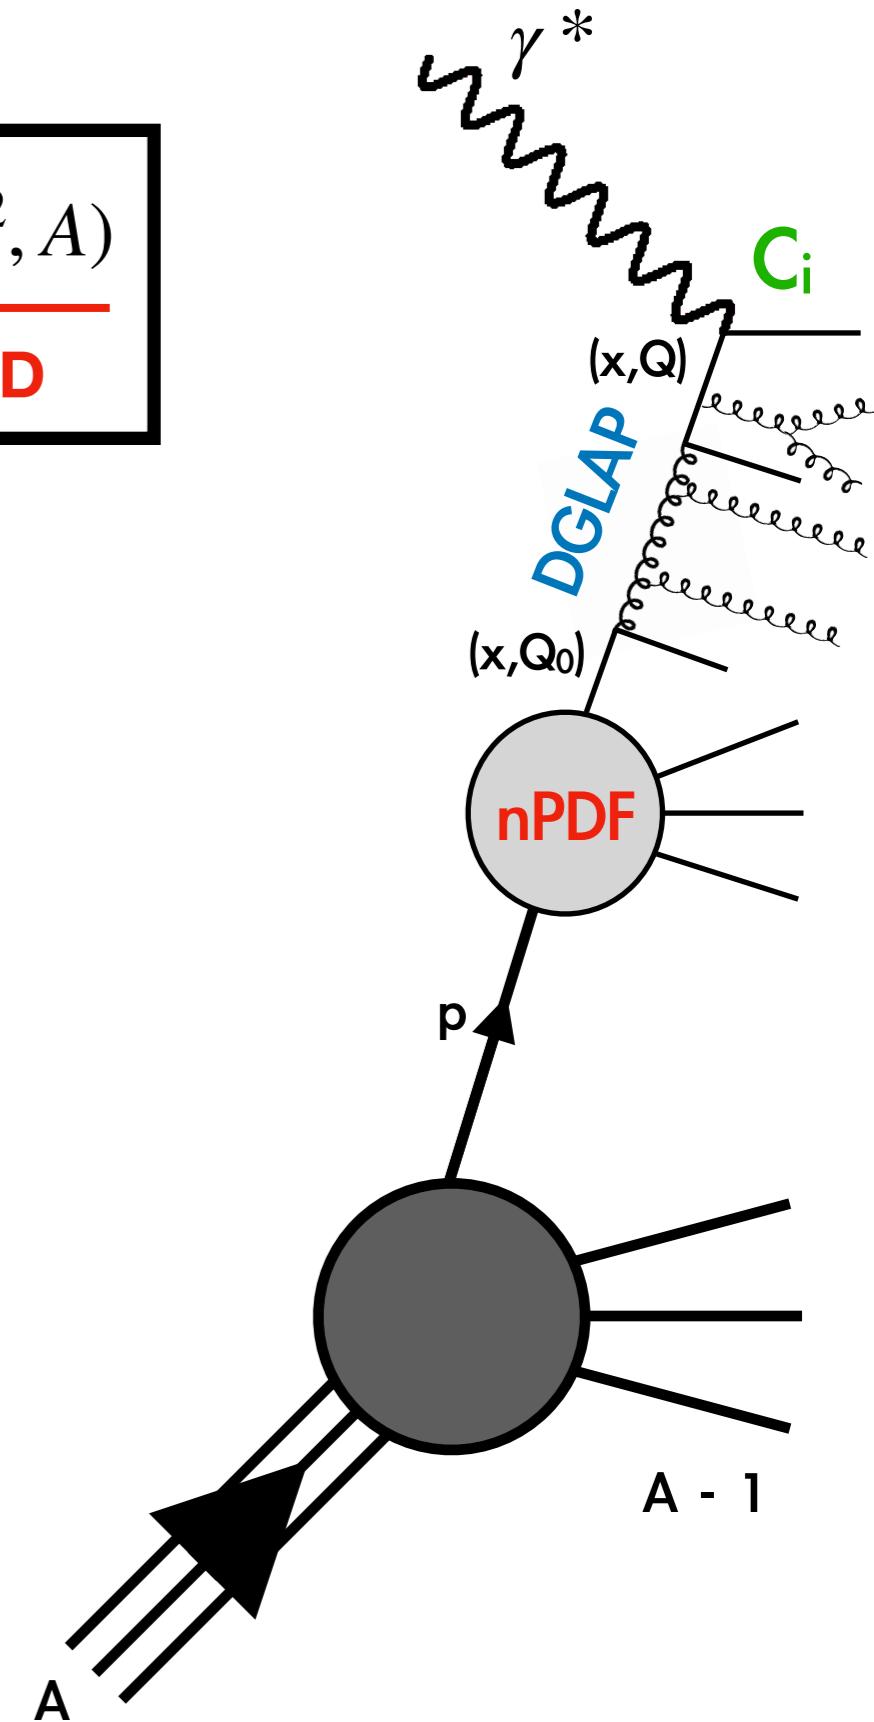

EM F_2 ($Q < M_Z$)

$$F_2(x, Q^2, A) = \sum_i^{n_f} \sum_j^{n_f} C_i(x, Q^2) \underset{\text{pQCD}}{\otimes} \Gamma_{ij}(x, Q^2) \underset{\text{DGLAP}}{\otimes} q_j(x, Q_0^2, A)$$
